Who Uses ViewIt?

ViewIt is used by a wide range of programmers:

 • Programmers using Fortran, Pascal, C, or other procedural languages.   No other Mac programming tool supports ViewIt's range of features or makes it so easy to add a Mac interface to existing programs.

 • Programmers using object-oriented development environments who are looking for a simpler way to create and manage complex windows.

 • Programmers who have a need to make use of one of our advanced custom controls: EditControls, QuickControl, or CommControl (see product list).

 • Programmers using PlotLink's optional high-level dialogs to support user editing of plot attributes.

 • HyperCard programmers (and programmers using other high-level programming environments) who are looking for an easier way to add standard Mac windows and dialogs to their projects.
