

**This README accompanied the original Colorizing Hypercard 1.0 stack. It has been included for information.**

Enclosure: ColorizingHC.pkg

Hey -

Enclosed is a treat for all the HyperFaithful, those who have been wishing there was SOME way to add color to HyperCard...

### Colorizing HyperCard 1.0

This is a stack which documents and describes an XCMD that allows you, the scripter, to add color “backdrops” to your HyperCard stacks. This color layer is automatically updated whenever HyperCard redraws a stack - no more idle scripts to redraw your color screen, no more flashing when that pesky user holds down command-option.

This stack and it's XCMDs have been released with no restrictions. You may use them in any way you wish - commercial, public, private, whatever.

Have fun!
