KillNBP Clarification
Networking

Written by: Mark Bennett   August, 1988

This technical note clears up some confusion regarding the Name Binding Protocol KillNBP function.

The description of the `PKillNBP` function on page 519 of *Inside Macintosh Volume V* is somewhat confusing. The data type of the parameter `thePBptr` is incorrectly given as `ATPPBPtr` and the pointer to the queue element from the NBP call to be aborted is incorrectly given as being passed in `aKillQEl`. The following is a correct description of the `KillNBP` function:

KillNBP function

FUNCTION PKillNBP (thePBptr: MPPPBPtr; async: BOOLEAN) : OSErr;

Parameter block

➜	26	csCode	word Always PKillNBP
➜	28	nKillQEl	pointer Pointer to queue element
