System 7 Pack™'s "Frontier" command is a special variation of the DoScript command. It differs from DoScript in that it's hard wired to UserLand Frontier™ and waits for a reply. If you wish to run Frontier commands in the background, you can use the DoScript command instead since it doesn't wait for a reply. To use DoScript, you must create a target address for Frontier using the application signature, which is "LAND". Here's an example of how to do it:

```
cmd:="some frontier commands"              ` we can use any Frontier™ command
$err := MakeAddress("LAND";$frontier)      ` create a target address for Frontier™
if ($err # 0)
      Alert("Frontier isn't running.")
else
      $err:=DoScript($frontier;cmd)        ` tell Frontier™ to run our script
      $err := DisposeAddress($frontier)    ` we're finished with the address
end if
`
` Continue with other 4D commands while Frontier™ runs in the background
`
```
