

## **Brilliance Labs, Inc. Announces CyberGO to Launch With Microsoft® Internet Explorer 3.0**

**Gainesville, FL - July 26, 1996** - Brilliance Labs, Inc. today announced plans to ship CyberGO by August 9. CyberGO is the latest incarnation of GO, the world's oldest game, and is built on the ActiveX™ technology found in Microsoft Internet Explorer 3.0. Matches are arranged and played without ever leaving the Web page, using customizable board graphics and sound effects. A lobby-server component will also be shipped, in the form of an ISAPI extension for Microsoft Internet Information Server and as a Perl script for Unix platforms.

"We see a real benefit in leveraging the tremendous capabilities of Internet Explorer," said Garrett Clark, president of Brilliance Labs. "As a small company, we can't afford to be reinventing the wheel when this industry's rate of change is still so dramatic. With the grunt work out of the way we are freed to put tremendous focus on our areas of true innovation. Our upcoming series of ActiveX game controls will further build on Microsoft solutions to deliver stunning 3-D graphics and sound."

The wonderfully simple rules of GO mask a vast array of complex possibilities, offering enjoyment to every level of player. Finding partners to play is quick and simple with the server program in place. Gamesites that feature CyberGO are free to customize the entire game experience using Visual Basic® Script or JavaScript to enhance a rich HTML interface. Features like a chat interface and a status window can be built into a Web site in any desired way, using IE 3.0's powerful scripting capabilities to manipulate the game's COM interface.

"A lot of companies are wondering how to make money on the Internet. We are wondering how to give people new experiences, new dimensions of living," says Clark. "The Web is all about freedom, about finding a voice for your expressions. We

think Microsoft is upholding that spirit by giving away such an amazing product like IE 3.0 free of charge."

"We are excited that the CyberGO ActiveX Control has been released in conjunction with Internet Explorer 3.0." said Tom Button, director of marketing for Microsoft's Internet Platform and Tools division. "CyberGO joins the growing ranks of ActiveX controls available today for Web site producers who want to build engaging, effective sites that give users the most dynamic experience possible."

CyberGO will be available for download on August 9. It will be free of charge. To acquire the control please visit the Brilliance Labs Web site at:
