

rtfhtml - A Filter to Translate RTF to HTML

RTF is a document formatting language developed by Microsoft. There are many word processing packages (Microsoft Word, Word Perfect, Frame Maker...) that can read or write **RTF** format files. *rtfhtml* was designed to translate existing **RTF** documents into **HTML** - the format of the **World Wide Web**. *rtfhtml* can also be used to author new documents specifically for the **WWW**.

The latest version of *rtfhtml* is 2.7.5

- [Known Bugs and requested features.](#)

How to Get the Package

- [Macintosh binary](#)
- [Source Package for UNIX](#)
- [sun4 binary](#)
- [sun4 Solaris binary](#)

Sample Documents

To get you started, I have a Style Sheet for Microsoft Word. This has definitions of the Paragraph styles that I use for authoring Web documents. It renders my RTF versions of the documents in a style that is close to what XMosaic 2.1 displayed (at one time.)

It is located [here](#).

The HTML version is [here](#).

About RTF

RTF (Rich Text Format) was designed by Microsoft as an open format for interchanging documents between Microsoft Word and other word processing packages. It is supported by WordPerfect, FrameMaker, Interleaf and many other packages on UNIX, Apple, Macintosh, Next, and PC platforms.

The specification for RTF and a set of filters for translating RTF to plain-text, troff and Tex and LaTeX are available at: <ftp://ftp.primite.wisc.edu/pub/RTF>
