Lists

There are three different list styles. All of them can include new lists.
- unordered list
2. ordered list
  definition list
      text, text, text

Unordered list

<UL [TYPE=DISC|CIRCLE|SQUARE]>
Stands for 'unordered list'. Starts a new unordered list. The bullet (•) can be changed with TYPE, between DISC (•), CIRCLE (°) and SQUARE (€). Must end with </UL>

<LI [TYPE=DISC|CIRCLE|SQUARE]>
Stands for 'list insert' or 'list item'. Starts a new line. Use it inside a <UL> text. Must end with </LI>

Ordered list

<OL [TYPE=A|a|I|i] [START=n]>
Start a new ordered list in the same way as <UL>. TYPE changes the numbers in the front of the entries between A,B,C (A), a,b,c (a), I,II,III (I), i,ii,iii (i) and 1,2,3 (only <OL>). START starts the numeration at n. Must end with </OL>

<LI [TYPE=A|a|I|i]>
Stands for 'list insert' or 'list item'. Works in the same way as in an unordered list. Must end with </LI>

Definition list

<DL>
Starts a defined list. Must end with </DL>

<DT>
Stands for 'defined tag'. Insert a new 'header' in the list. The text shows up in bold. Must end with </DT>

<DD>
Use it to display normal text in a new line inside the list. Must end with </DD>

Menu list

There are also two other tags which look the same as a list. These are often used in ftp-pages, but aren't supported in all browsers.

<MENU [DINGBAT=text] [CLEAR=align]>
Starts the new menu list. DINGBAT is the name of an icon which will start the line. Can be "text.document", an icon of a small text file, "no" which is no dingbat at all, or about 30 others.

Directory list

<DIR>

About the same use as <UL>. Must end with </DIR>.

<LI>

Start tag for a new list item inside the directory list. Must end with </LI>.
