

A system for doing
linear regression.

Enter or Paste data into the appropriate columns from your favourite graphing programme. A linear regression of the form $y = mx + b$ can be calculated from the menus. At present the maximum number of points is 40 but this may be increased to any value if you contact me.

An un-weighted fit:
Ignore the y error data column. (i.e leave all blank).

A weighted fit:
Only errors in y are supported.
