

Applications Definitions

Note: This category has a special listing feature. Normally unsorted, if you hold down the <option> key before selecting this menu item, the listing will be alphabetically sorted across volumes. This is also true if the <option> key is held down while choosing Reports... from the TattleTech pull down menu.

In addition, the list may be restricted to a particular volume(s) by selecting Specify Volumes in the TattleTale menu. If the list contains more than 150-200 applications, the list may run out of memory and you will be informed that the list is incomplete. If this happens to you, a complete listing can be sent to a printed report or text file under the Reports... menu.

- Application = Application name
 - ◊ Version = Version number and (32-bit cleanliness) for applications
 - ◊ Creator = Finder Creator
 - ◊ Is PowerPC Native = Can the application run native on the Power Mac
 - ◊ Supports Local HL Events = Is the application Apple Event aware
 - ◊ Supports Remote HL Events = Does the application support remote events
 - ◊ Preferred Size = As set in the GetInfo dialog, the memory partition size which will be used if memory is available. The user specified value from 'SIZE' ID 0 is used if available, otherwise ID -1
 - ◊ Minimum Size = As set in the GetInfo dialog, the minimum memory partition size which will be used. The user value from ID 1 or ID 0 from 'SIZE' is used as appropriate and available, otherwise ID -1
 - ◊ SIZE Flags = In hex, the value of the 'SIZE' resource. The IDs are searched from 1 thru -1 and the first found is used.
 - ◊ Path Name = Location of file
