Tos–GNU C Library Functions

This reference card describes the available library functions of GNU C on the Atari ST and is currently based on the library from Jwahar R. Bammi at patchlevel 83. For the most part the functions are alphabetically sorted by function name.

Some of the mentioned functions are only available, when MiNT, the TOS multitasking extension from Eric R. Smith is running, or if you have a TT. The earlier are marked with "(MiNT)", the latter with "(TT)".

Additionally, this reference card is postcard-ware. If you find it useful, send a postcard to this address: Frank Ridderbusch, Sander Str. 17, W-4790 Paderborn, Germany.

Standard I/O

#include <stdio.h>

The following aliases for some of the below functions are defined.

getc	fgetc
ungetc	fungetc
putc	fputc
getchar()	fgetc(stdin)
ungetchar(c)	fungetc((c),stdin)
putchar(c)	fputc((c),stdout)

void **clearerr** (*FILE *fp*);
Clear error and EOF status of stream *fp*. (Macro)

char ***ctermid** (*char *name*);

int **fclose** (*FILE *fp*);
Close the stream *fp*.

FILE ***fdopen** (*int fd*, *const char *mode*);
Connect a file pointer to the file descriptor *fd* with mode *mode*.

int **feof** (*FILE *fp*);
Test EOF status of stream *fp*. (Macro)

int **ferror** (*FILE *fp*);
Test error status of stream *fp*. (Macro)

int **fflush** (*FILE *fp*);
Write data from internal buffer of stream *fp* to the file.

int **fgetc** (*FILE *fp*);
Get a character from stream *fp*.

int **fgetpos** (*FILE *fp*, *fpos_t *ptr*);
Put the current position of the file pointer of stream *fp* into the address *ptr*.

char ***fgets** (*char *buf*, *int max*, *FILE *fp*);
Get a string including the NL character from stream *fp* with *max* byte into *buf*.

int **fileno** (*FILE *fp*);
Get file descriptor of stream *fp*. (Macro)

FILE ***fopen** (*const char *fname*, *const char *mode*);
Open file *fname* with mode *mode* for stream I/O.

int **fputc** (*int c*, *FILE *fp*);
Write a character *c* into stream *fp*.

int **fputs** (*const char *buf*, *FILE *fp*);
Write the string in *buf* into stream *fp*.

size_t **fread** (*void *buf*, *size_t sz*, *size_t no*, *FILE *fp*);
Read *no* items of size *sz* from stream *fp* into *buf*.

FILE ***freopen** (*const char *fname*, *const char *mode*, *FILE *fp*);
Reopen *fp* with file *fname* and mode *mode*.

int **fseek** (*FILE *fp*, *long pos*, *int whence*);
Move the the file pointer from stream *fp* to position *pos* relativ to *whence*.

int **fsetpos** (*FILE *fp*, *fpos_t *ptr*);
Set the position of the file pointer of stream *fp* to the value at address *ptr*.

long **ftell** (*FILE *fp*);
Get the current position of the file pointer from stream *fp*.

int **fungetc** (*int c*, *FILE *fp*);
Push the character *c* back onto stream *fp*.

size_t **fwrite** (*const void *buf*, *size_t size*, *size_t no*, *FILE *fp*);
Write *no* items of size *sz* from *buf* into stream *fp*.

long **getl** (*FILE *fp*);
Read a long value from stream *fp*.

char ***gets** (*char *buf*);
Get a string from <stdin> into *buf*. The NL character is discarded.

short **getw** (*FILE *fp*);
Read a short value from stream *fp*.

int **pclose** (*FILE *fp*);
Close the stream created by **popen()**.

void **perror** (*const char *str*);
Display error message starting with *str* depending on *errno*.

FILE ***popen** (*const char *command*, *const char *mode*);
Open a pipe with *mode* to *command*. (Faked by temporary files)

int **printf** (*const char *fmt*, ...);
int **fprintf** (*FILE *fp*, *const char *fmt*, ...);
int **sprintf** (*char *buf*, *const char *fmt*, ...);
int **vprintf** (*const char *fmt*, *char**);
int **vfprintf** (*FILE *fp*, *const char *fmt*, *char**);
int **vsprintf** (*char *buf*, *const char *fmt*, *char**);
Formated output to either <stdout>, *fp* or *buf* with fixed or variable number of arguments.

The following table lists the identifying letters of the *fmt* string.

scanf	printf	Meaning
d	d,i	Decimal number
o	o	Octal number
x	x,X	Hexadecimal number
u	u	Unsigned decimal n.
b		Unsigned binary int.
i		Any base num.
D	D	Long Decimal number
O	O	Long Octal number
U	U	Unsigned long decimal
X		Long Hexadecimal
ld,lo,lx	ld,li,lo,lx,lX	Long ... number
lb		Unsigned binary long
li		Any base num. long
hd,ho,hx	d,o,x,X	Short ... number
c	c	Character
s	s	String
	p	Pointer
[...]		Str. consist. of char.
e,f,g	f	Fixed-point number
e,f,g	e,E	Floating-point number
le,lf,lg		Double prec. ... n.
E,F,G		Double prec. ... n.
Le,Lf,Lg	Le,LE,Lf	Long Double ... n.
	g,G,Lg,LG	e/E or f - shortest used

long **putl** (*long c*, *FILE *fp*);
Output the long value *c* into the stream *fp*.

int **puts** (*const char *buf*);
Write the string in *buf* to <stdout> appending a NL character.

short **putw** (*short c*, *FILE *fp*);
Output the short value *c* into the stream *fp*.

int **remove** (*const char *fname*);
Remove file with name *fname*.

int **rename** (*const char *old*, *const char *new*);
Change name of file from *old* to *new*.

void **rewind** (*FILE *fp*);
Reset the filepointer from stream *fp* to position 0.

int **scanf** (*const char *fmt*, ...);
int **fscanf** (*FILE *fp*, *const char *fmt*, ...);
int **sscanf** (*const char *buf*, *const char *fmt*, ...);
Formated input from either <stdin>, *fp* or *buf*. (For a description of the letters in the *fmt* string see **printf**.)

void **setbuf** (*FILE *fp*, *char *buf*);
Set buffer of stream *fp* to *buf*.

The following functions are defined as macros.

int **setvbuf** (*FILE *fp*, *char *buf*, *int mode*, *size_t sz*);
Set buffer of stream *fp* to *buf* with size *sz* and mode *mode*.

FILE ***tmpfile** (*void*);
Create a temporary file. File is deleted on normal termination.

char ***tmpnam** (*char *buf*);
Create a string for a temporary filename.

void **_binmode** (*int bool*);
Set default open mode to binary (bool = true) or text.

I/O Control

#include <ioctl.h>

int **ioctl** (*int fd*, *int cmd*, *void *arg*);
Set or inquire i/o dependend parameter.

int **stty** (*int fd*, *struct sgttyb *_tty*);
int **gtty** (*int fd*, *struct sgttyb *_tty*);
Set or inquire i/o parameters for descriptor *fd*.

#include <fcntl.h>

int **fcntl** (*int fd*, *int cmd*, ...);
Set or inquire file i/o dependend parameter (MiNT).

Memory Management

#include <stdlib.h>

void ***calloc** (*size_t no*, *size_t sz*);
Allocate and initialize memory for *no* items of size *size*.

void ***malloc** (*size_t sz*);
Allocate *sz* bytes of memory.

void ***realloc** (*void *ptr*, *size_t sz*);
Resize memory pointed to by *ptr* to size *sz*.

void **free** (*void *ptr*);
Free memory obtained by **calloc**, **malloc** or **realloc**.

void ***alloca** (*size_t sz*);
Allocate *sz* bytes from the current function stack.

void **_malloczero** (*int bool*);
Zero allocated memory blocks. Default == false.

void **_mallocChunkSize** (*size_t Siz*);
Get memory from OS in atleast *Siz* sized blocks. Default == 4K

#include <memory.h>

void ***_calloc** (*unsigned long no*, *unsigned long sz*);
void ***_malloc** (*unsigned long sz*);
void ***_realloc** (*void *ptr*, *unsigned long sz*);
Apart from the above functions, these three functions are additionally declared in memory.h and take *long* arguments.

Character Classification and Conversion

The following functions return $\neq 0$, if character *c* belongs to the specified character set; 0 otherwise.

#include <ctype.h>

function	set
isalnum(*c*)	Letter or Digit
isalpha(*c*)	Letter
isascii(*c*)	ASCII character (Codes: 0...0177)
iscntrl(*c*)	Control character (Codes: 0...037, 0177)
isdigit(*c*)	Digit
isgraph(*c*)	Printable character except space
islower(*c*)	Lowercase letter
isprint(*c*)	Printable character

ispunct(*c*) Punctuation char. (not letter, digit or control)
isspace(*c*) Space, Tab, CR, NL, VT, FF or BS
isupper(*c*) Uppercase letter
isxdigit(*c*) Hexadecimal digit
iswhite(*c*) same as ispace()
isodigit(*c*) Octal digit
iscymf(*c*) Character starting a C identifier
iscym(*c*) Characters continuing a C identifier

Character conversion functions

function	Meaning
toupper(*c*)	Convert to uppercase letter
_toupper(*c*)	Convert to uppercase letter (macro)
tolower(*c*)	Convert to lowercase letter
_tolower(*c*)	Convert to lowercase letter (macro)
toint(*c*)	Convert digit to integer

String Handling

#include <string.h>

int **bcmp** (*const void *ptr1*, *const void *ptr2*, *size_t no*);
Compare *no* of bytes at position *ptr1* with *ptr2*.

void **bcopy** (*const void *src*, *void *dst*, *size_t len*);
Copy *len* bytes from position *src* to *dst*.

void **bzero** (*void *dst*, *size_t len*);
Set *len* bytes at position *dst* to 0.

char ***index** (*const char *str*, *int charw*);
char ***rindex** (*const char *str*, *int charw*);
Same as **strchr**() (**strrchr**()).

void ***memccpy** (*void *dst*, *const void *src*, *int ucharstop*, *size_t no*);
Copy characters from *src* to *dst* until character *ucharstop*, but copy at most *no* bytes.

void ***memchr** (*const void *ptr*, *int ucharwanted*, *size_t no*);
Find character *ucharwanted* in area at *ptr*, but compare at most *no* character.

int **memcmp** (*const void *ptr1*, *const void *ptr2*, *size_t no*);
Compare *no* bytes from memory area at *ptr1* with area at *ptr2*.

void ***memcpy** (*void *dst*, *const void *src*, *size_t no*);
Copy *no* of bytes from area at *src* to *dst*.

void ***memset** (*void *ptr*, *int ucharfill*, *size_t no*);
Set *no* of bytes at position *ptr* to character *ucharfill*.

char ***strcat** (*char *dst*, *const char *src*);
char ***strncat** (*char *dst*, *const char *src*, *size_t no*);
Concatenate the string at *src* to the string at *dst*. **strncat**() concatenates at most *no* characters.

char ***strchr** (*const char *str*, *int charw*);
char ***strrchr** (*const char *str*, *int charw*);
Find first (last) occurence of character *charw* in string *str*.

int **strcmp** (*const char *str1*, *const char *str2*);
int **strncmp** (*const char *str1*, *const char *str2*, *size_t no*);
Compare string *str1* with string *str1*. **strncmp**() compares at most *no* characters.

char ***strcpy** (*char *dst*, *const char *src*);
char ***strncpy** (*char *dst*, *const char *src*, *size_t no*);
Copy string at *src* to *dst*. **strncpy**() copies at most sl no characters.

size_t **strcspn** (*const char *str*, *const char *rej*);
Find length of initial segment of *str* consisting entirely of characters not from *rej*.

char ***strdup** (*const char *str*);
Return a duplicate of string *str*.

char ***strerror** (*int errno*);
Map error number *errno* to a descriptive string.

int **stricmp** (*const char *str1*, *const char *str2*);
int **strcmpi** (*const char *str1*, *const char *str2*);
int **strnicmp** (*const char *str1*, *const char *str2*, *size_t no*);
int **strncmpi** (*const char *str1*, *const char *str2*, *size_t no*);
Same as **strcmp**() and **strncmp**(), except the case is ignored.

size_t **strlen** (*const char *str*);
Return length of string *str*.

char ***strlwr** (*char *str*);
Change all character from string *str* to lowercase.

char ***strpbrk** (*const char *str*, *const char *breakat*);
First occurrence of a character from string *breakat* in string *str*.

char ***strrev** (*char *str*);
Reverse all charcters in string *str*. First character becomes last character.

size_t **strspn** (*const char *str*, *const char *accept*);
Find length of initial segment of *str* consisting entirely of characters from *accept*.

char ***strstr** (*const char *str*, *const char *wanted*);
Find first occurence of string *wanted* in string *str*.

char ***strtok** (*char *str*, *const char *delim*);
Retrieve fields from string *str*, that are delimited by characters from string *delim*.

Process Management

#include <stdlib.h>

void **abort** ( );
Immediatly abort the running program.

int **atexit** (*void (*func*)());
Register a function for execution on termination.

void **exit** (*int ret*);
Exit current process with return value *ret*.

int **system** (*const char *prog*);
Execute command *prog* passed as a string.

#include <process.h>

int **spawnl** (*int mode*, *char *path*, . . .);
int **spawnv** (*int mode*, *char *path*, *char **argv*);
int **spawnle** (*int mode*, *char *path*, . . .);
int **spawnve** (*int mode*, *char *path*, *char **argv*, *char **envp*);
Spawn a new process. (Only `P_WAIT` is allowed for *mode*).

int **spawnvp** (*int mode*, *char *name*, *char **argv*);
int **spawnlp** (*int mode*, *char *name*, . . .);
Execute a program on the defautl system execution path. (The current directory is always searched first.)

Date and Time

#include <time.h>

char ***asctime** (*const struct tm *t*);
Convert "time" structure to a string.

clock_t **clock** ( );
Return process time used so far in units of CLK_TCK ticks per second (under TOS, 200 per second).

char ***ctime*** (*const time_t *t*);
Convert time in seconds since 1970 to a string.

double **difftime** (*time_t t1*, *time_t t2*);
Return difference between two "time_t" types.

struct tm ***gmtime*** (*const time_t *t*);
Get the Greenwich Mean time.

struct tm ***localtime*** (*const time_t *t*);
Convert given time in seconds since 1970 to local time.

time_t **mktime** (*const struct tm *t*);
Take a time structure and convert it into representation "seconds since midnight January 1 1970, GMT".

size_t **strftime** (*char *s*, *size_t maxsize*, *const char *format*, *const struct tm *timeptr*);
Print formatted information about a given time.

time_t **time** (*time_t *t*);
Return time in seconds since midnight January 1 1970, GMT.

void **tzset** ( );
Set the timezone and dst flag to the local rules (depending on environment variable "TZ").

File and Directory Information

#include <stat.h>

int **fstat** (*int fd*, *struct stat *info*);
Obtain information about file assosiated with filedescriptor *fd*.

int **lstat** (*const char *fname*, *struct stat *info*);
Like *stat* but return info about *symbolic links*.

int **stat** (*const char *fname*, *struct stat *info*);
Obtain information about file *fname*.

#include <dirent.h>

int **closedir** (*DIR *dirp*);
Close directory assosiated with *dirp*.

DIR ***opendir** (*const char *dirname*);
Open directory *dirname* for reading.

struct dirent ***readdir** (*DIR *dirp*);
Read an entry from directory assosiated with *dirp*.

void **rewinddir** (*DIR *dirp*);
Seek to the beginning of directory assosiated with *dirp*.

void **seekdir** (*DIR *dirp*, *off_t loc*);
Seek to position *loc* in the directory assosiated with *dirp*.

off_t **telldir** (*DIR *dirp*);
Get the current position in directory assosiated with *dirp*.

int **alphasort** (*struct dirent **src*, *struct dirent **dst*);

#include <ftw.h>

int **ftw** (*char *path*, *int (*fn*)(),int param);
Recursively walk tree rooted at *path* applying function *fn*.

Regular Expressions

#include <regexp.h>

regexp ***regcomp** (*char *exp*);
Compile a regular expression into an internal code.

int **regexec** (*regexp *prog*, *char *string*, *int bolflag*);
Match the previously compiled expression *prog* against the *string*.

void **regsub** (*regexp *prog*, *char *source*, *char *dest*);
Substitute the previously matched expression *prog* with *source*. The result is copied to *dest*.

void **regdump** (*regexp *r*);
Dump the regular expression *r* onto <stdout> in vaguely comprehensible form.

Setjmp & Signal Stuff

#include <setjmp.h>

int **setjmp** (*jmp_buf buf*);
Prepare buffer *buf* for non local goto via **longjmp**().

void **longjmp** (*jmp_buf buf*, *int rv*);
Return to previously saved context *buf* with return value *rv*.

int **catch** (*jmp_buf id*, *int (*fn*)(void));

void **throw** (*jmp_buf id*, *int rv*);

#include <signal.h>

__Sigfunc **signal** (*int sig*, *__Sigfunc func*);
Install the handler *func* for signal *sig*.

int **raise** (*int sig*);

long **sigsetmask** (*long mask*);
(MiNT)

long **sigblock** (*long mask*);
(MiNT)

U*IX Compatibility Routines

#include <unistd.h>

void **_exit** (*int ret*);
Exit the current process without cleaning up. (This is a **Pterm()**)

int **access** (*const char *fname*, *int mode*);
Check, if file *fname* is accessable with mode *mode*.

unsigned int **alarm** (*unsigned int sec*);
Instructs the alarm clock of the calling process to send the signal SIGALRM to the calling process after *sec* seconds

int **chdir** (*const char *dname*);
Chane the current working directory to *dname* including drive specification.

int **chmod** (*const char *fname*, *int mode*);
Change permissions of file *fname* to *mode*.

int **chown** (*const char *fname*, *int uid*, *int gid*);
Change owner and group of file *fname*. (Fake for now)

int **close** (*int fd*);
Close the file assosiated with file descriptor *fd*.

int **creat** (*const char *fname*, *unsigned mode*);
Create the file *fname* with mode *mode*.

int **dup** (*int fd*);
Duplicate filedescriptor *fd*.

int **dup2** (*int fd1*, *int fd2*);
Duplicate filedescriptor *fd1* to *fd2*.

int **execl** (*char *path*, . . .);
int **execle** (*char *path*, . . ., *char **envp*);
int **execlp** (*char *path*, . . .);
Execute a new process from *path* after a *fork()*, *execlp* use the PATH environment.

int **execv** (*char *path, char **argv*);
int **execvp** (*char *path, char **argv*);
int **execve** (*char *path, char **argv, char **envp*);
Execute a new process from *path* after a *fork()*, using the argv method. *execvp* use the PATH environment.

int **fork** ( );
int **vfork** ( );
Simulate a non multitasking fork. *vfork* shares data + stack with parent.

char ***getcwd** (*char *buf, int size*);
char ***getwd** (*char *buf*);
Get the current working directory.

unsigned short **getgid** ( );
unsigned short **getuid** ( );
Get user and group id's. (Fake for now, returning alsways root).

unsigned short **getegid** ( );
unsigned short **geteuid** ( );
Get effective user and group id's.

int **getgroups** (*int setlen, gid't *gidset*);
Retrieves the current group access list of the user process and stores it in *gidset*.

char ***getlogin** ( );
Return the user's login name. (Password file and environment are seached in order).

int **getopt** (*int argc, const char **argv, const char *opt*);
Extract the command line options described by *opt* from *argv*.

int **getpagesize** (*void*);
Get system page size

char /***getpass** (*char *prompt*);

int **getpgrp** ( );
int **setpgrp** ( );
Get or create a process group (This basically a fake; both return **getpid()**).

int **getpid** ( );
int **getppid** ( );
int **setpgid** (*pid't pid, pid't pgid*);
Return a process id for the currently running process (or the parent process) (from the basepage).

char ***initstate** (*unsigned seed, char *arg_state, int n*);
Initialize state array of generator for *random*.

int **isatty** (*int fd*);
Check, if *fd* is associated with a terminal (screen).

int **link** (*const char *old , const char *new*);
Make a new link from *new* to *old*. Always fails.

long **lseek** (*int fd, long pos, int whence*);
Set the current file posistion to position *pos* relative to *whence*.

int **mkdir** (*const char *dname, unsigned mode*);
Make a directory with name *dname* and change its mode to *mode*.

char ***mktemp** (*char *pattern*);
Return a filename for a temporary file, build after *pattern*.

int **open** (*const char *fname, int mode, . . .*);
Open the file *fname* with mode *mode*.

long **pathconf** (*const char *path, int name*);
Get configurable pathname variables.

The following table lists the possible values for *name*.

name	Meaning
_PC_IOPEN_MAX	internal limit on open files
_PC_LINK_MAX	max # of links
_PC_PATH_MAX	max len of a full pathname
_PC_NAME_MAX	max len of individual name
_PC_PIPE_BUF	bytes written atomically to fifo
_PC_NO_TRUNC	filename trucation

int **pause** (*void*);
Suspends the calling process until it receives a signal.

int **pipe** (*int *fildes*);
Creates a pipe and returns two file descriptors. *Fildes[0]* for reading, *fildes[1]* for writing.

void **psignal** (*int signal, const char *prefix*);
Print a error message describing the signal with a user comment.

long **random** ( );
Return a pseudo random number in the range from 0 to 2^31 - 1.

int **rmdir** (*const char *dname*);
Remove the directory with name *dname*.

int **read** (*int fd, void *buf, unsigned cnt*);
long **_read** (*int fd, void *buf, unsigned long cnt*);
Read *cnt* bytes from file descriptor *fd* into buffer *buf*.

int **readlink** (*char *filenam, char *linkto, int siz*);
Read value of a symbolic link

void ***sbrk** (*unsigned long size*);
void ***lsbrk** (*long size*);
Emulation of the U*ix **sbrk()** system call.

void **setlinebuf** (*void *fp*);
Change the buffering on stream *fp* from block/unbuffered to line buffered.

int **setgid** (*int gid*);
int **setuid** (*int uid*);
Set the real group or user id.

int **setegid** (*int gid*);
int **seteuid** (*int uid*);
Set the effective group or user id.

int **setregid** (*int rgid, int egid*);
int **setreuid** (*int ruid, int euid*);
Set real and effective group or user id.

int **setsid** (*void*);
Create session and set process group ids

char ***setstate** (*char *arg_state*);
Switch state of generator for *random*.

void **sigpause** (*long mask*);
Suspends the calling process until it receives a signal.

int **sleep** (*int n*);
Sleep for *n* number of seconds.

int **srandom** (*unsigned int x*);
Seed generator for *random*.

int **stime** (*long *time*);
Set the current time to *time* in U*ix format.

int **symlink** (*char *oldname, char *newname*);
Make symbolic link to a file

long **sysconf** (*int name*);
Get configurable system variables.

The following table lists the possible values for *name*.

name	Meaning
_SC_MEMR_MAX	memory regions per process
_SC_ARG_MAX	max length of cmdln
_SC_OPEN_MAX	max # of open files per process
_SC_NGROUPS_MAX	max # of supp gids
_SC_CHILD_MAX	max # processes per user

long **tell** (*int fd*);
Get the current file position of the file associated with *fd*.

int **times** (*struct tms *buf*);
Get process times into *buf*.

char ***ttyname** (*int file*);

int **umask** (*int mode*);
Set access mask. (Fake for now)

int **unlink** (*const char *fname*);
Remove the file with name *fname*.

void **usleep** (*unsigned long n*);
Sleep for *n* number of milliseconds.

int **utime** (*const char *fname*, *const struct utimbuf *ftime*);
Set the modification time and date of file *fname* to *ftime*.

int **write** (*int fd*, *const void *buf*, *unsigned cnt*);
long **_write** (*int fd*, *const void *buf*, *unsigned long cnt*);
Write *cnt* bytes from buffer *buf* to file descriptor *fd*.

int **wait** (*int *exit_code*);
Wait for child process.

Password and Group Handling

#include <pwd.h>

void **endpwent** ( );
Close password file.

struct passwd ***getpwent** ( );
Return an entry from the password file.

struct passwd ***getpwuid** (*int uid*);
Return the entry from the password file for *uid*.

struct passwd ***getpwnam** (*const char *user*);
Return the entry from the password file for *user*.

void **setpwent** ( );
Open password file for further operations.

void **setpwfile** (*char *fname*);
Use the *fname* instead of `/etc/passwd` as password file.

#include <grp.h>

void **endgrent** ( );
Close group file.

struct group ***getgrent** ( )
Return an entry from the group file.

struct group ***getgrgid** (*int gid*);
Return the entry from the group file for *gid*. (Mostly fake, returning root or user as groupnames)

struct group ***getgrnam** (*char *gname*);
Return the entry from the group file for *gname*. (Mostly fake, returning root or user as groupnames)

Value Conversion

#include <stdlib.h>

double **atof** (*const char *str*);
Return double value of number presented in *str*.

int **atoi** (*const char *str*);
Return int value of number presented in *str*.

long **atol** (*const char *str*);
Return long value of number presented in *str*.

int **abs** (*int val*);
long **labs** (*long val*);
Return absolute value of *val*.

long **strtol** (*const char *nptr*, *char **endptr*, *int base*);
unsigned long **strtoul** (*const char *nptr*, *char **endptr*, *int base*);
Return the value of the number in *nptr* with *base* putting the endaddress of the numerical string into *endptr*.

double **strtod** (*const char *nptr*, *char **endptr*);
Return the double value of the number in *nptr* putting the endaddress of the numerical string into *endptr*.

#include <support.h>

char ***_itoa** (*int val*, *char *buf*, *int radix*);
char ***_ltoa** (*long val*, *char *buf*, *int radix*);
char ***_ultoa** (*unsigned long val*, *char *buf*, *int radix*);
Convert the value *val* to a string in *buf* according to *radix*.

#include <locale.h>

struct lconv ***localeconv** ( );
Get rules of the current locale

char ***setlocale** (*int category* , *const char *name*);
Define locale named in *name*.

Miscellaneous

int **_text_read** (*int fd*, *char *buf*, *int bytes*);
int **_text_write** (*int fd*, *char *buf*, *int bytes*);
The same as **read**() and **write**(), except the CR character is discarded on input and inserted on output.

#include <stdlib.h>

void ***bsearch** (*const void *key*, *const void *base*, *size_t num*, *size_t size*, *int (*cmp*)());
Binary search a field starting at *base* with *num* elements each size *size* for *key*.

div_t **div** (*int num*, *int denom*);
ldiv_t **ldiv** (*long num*, *long denom*);
Perform division and return both quotient and remainder.

char ***getenv** (*const char *name*);
Get the contents of the environment variable *name*.

void **qsort** (*void *base*, *size_t num*, *size_t size*, *int (*cmp*)());
Quick sort an array of *num* elements with size *size* starting at *base*.

int **rand** ( );
Return a pseudo random number in the range from 0 to `RAND_MAX`.

void **srand** (*unsigned int seed*);
Use *seed* to initialize the pseudo-random number generator.

#include <keycodes.h>

int **console_input_status** (*int handle*);
Check, if character is available from standart CON:. (This is the same as **Cconis**)

unsigned int **console_read_byte** (*int handle*);
Raw input from standart CON: without echoing to screen. (This is the same as **Crawcin**)

void **console_write_byte** (*int handle*, *int character*);
Write character *c* to handle *handle*. (This is a **Fwrite** with count 1)

#include <support.h>

void **dos2unx** (*const char *t_fname*, *char *u_fname*);
Convert filenames from TOS format to U*ix format.

time_t **dostime** (*time_t*);
Convert U*ix time to TOS time and date (lower word = time, upper word = date).

char ***findfile*** (*char *fname*, *char *path*, *char **ext*);
Locate the file *fname* along the paths in *path* with *ext* containing possible extensions.

void **fnmapfunc** (*fnmapfunc_t u2dos*, *fnmapfunc_t dos2u*);
Set mapping functions for the **unx2dos** and **dos2unx** routines.

int **symlink** (*char *old* , *char *new*);
Make a new symbolic link from *new* to *old*. Env. UNIX-MODE determines behavior.

int **readlink** (*char *fname* , *char *buf*, *int siz*);
Read the link for *fname* into *buf*.

time_t **unixtime** (*unsigned tostime*, *unsigned tosdate*);
Convert a TOS time/date pair into a U*ix time.

void **unx2dos** (*const char *u_fname*, *char *t_fname*);
Convert filenames from U*ix format to TOS format.

void **_set_unixmode** (*char *mode*);
Set features of the extended file system.

void **_uniquefy** (*char *dos*);
Make an unigue TOS filename for the extended file system.

#include <sysvars.h>

long **get_sysvar** (*void *var*);
Get the contents of the system variable *var*.

void **set_sysvar_to_long** (*void *var*, *long val*);
Set the system variable *var* to the long value *val*.

Profiling

#include <support.h>

also see *gprof.ttp* and *-pg* option to *gcc*

void **monstartup** (*void *lpc*, *void *hpc*);
High level interface to *profil*. *[lpc,hpc]* is the range to sample. Necessary memory is dynamically allocated.

void **monitor** (*void *lpc*, *void *hpc*, *void *buf*, *size_t bsiz*, *unsigned int nfunc*);
Low level interface to profil. *buf* is a user supplied buffer. PC samples over *[lpc,hpc]* and *mcount()* call records are accumulated in *buf*.

void **moncontrol** (*long flag*);
Selectively control profiling in a program.

int **profil** (*void *buf*, *unsigned long bsiz*, *unsigned long off*, *int shift*);
Execution time profil. Pc is examined every 20ms, (PC-off)≫ shift if in range, will increment short in *buf*.

Mathematical Functions

#include <math.h>

double **acos** (*double*);
double **acosh** (*double*);
double **asin** (*double*);
double **asinh** (*double*);
double **atan** (*double*);
double **atan2** (*double*, *double*);
double **atanh** (*double*);
double **ceil** (*double*);
double **copysign** (*double*, *double*);
double **cos** (*double*);
double **cosh** (*double*);
double **dabs** (*double*);
double **exp** (*double*);
double **fabs** (*double*);
double **floor** (*double*);
double **fmod** (*double*, *double*);
double **frexp** (*double*, *int* *);
double **ldexp** (*double*, *int*);
double **log** (*double*);
double **log10** (*double*);
double **modf** (*double*, *double* *);
double **poly** (*int*, *double* *, *double*);
double **pow** (*double*, *double*);
double **rint** (*double*);
double **sin** (*double*);
double **sinh** (*double*);
double **sqrt** (*double*);
double **tan** (*double*);
double **tanh** (*double*);
int **matherr** (*struct exception* *);
int **pmlcfs** (*int*, *int*);
int **pmlcnt** (*void*);
int **pmlerr** (*int*);
int **pmllim** (*int*);
int **pmlsfs** (*int*, *int*);

GEMDOS Calls via Trap 1

#include <osbind.h>

The following assignment is valid by default:

Device	handle	
CON:	0	Keyboard
CON:	1	Screen
AUX:	2	Serial port
PRN:	3	Parallel port

long **Cauxin** ( );
Read character from standart AUX:.

short **Cauxis** ( );
Check, if character is available from standart AUX:.

short **Cauxos** ( );
Check, if character can be written to standart AUX:.

void **Cauxout** (*short c*);
Write character *c* to standart AUX:.

long **Cconin** ( );
Read a character from standart CON:.

short **Cconis** ( );
Check, if character is available from standart CON:.

short **Cconos** ( );
Check, if character can be written to standart CON:.

void **Cconout** (*short c*);
Write character *c* to standart CON:.

void **Cconrs** (*char *buf*);
Read edited data from standart CON:. *buf[0]* contains number of characters minus 1 to read.

void **Cconws** (*const char *str*);
Write string *str* to standart CON:.

long **Cnecin** ( );
Raw input from standart CON: without echoing to screen, but with interpretation of CTRL-S, CRTL-Q and CRTL-C.

short **Cprnos** ( );
Check, if character can be written to standart PRN:.

void **Cprnout** (*short c*);
Write character *c* to standart PRN:.

long **Crawcin** ( );
Raw input from standart CON: without echoing to screen.

long **Crawio** (*short data*);
Raw I/O to standart CON:. If *data* = 0xff read from CON:, otherwise output to CON:.

short **Dcreate** (*const char *dname*);
Create a directory with name *dname*.

long **Ddelete** (*const char *dname*);
Remove a directory with name *dname*.

long **Dfree** (*DISKINFO *buf*, *short drv*);
Get available space of drive *drv* into *buf*. *drv* = 0 means current drive.

short **Dgetdrv** ( );
Get the number of the default drive.

long **Dgetpath** (*void *buf*, *short drv*);
Get the current directory of drive *drv*. *drv* = 0 means current drive.

long **Dsetdrv** (*short d*);
Set the number of the default drive.

long **Dsetpath** (*const char *path*);
Set path for current drive to *path*.

short **Fattrib** (*const char *fname*, *short rwflag*, *short attr*);
Get (*rwflag* = 0) or set (*rwflag* = 1) attribute byte of file *fname*.

long **Fclose** (*short handle*);
Close the file assosiated with *handle*.

struct _dta ***Fgetdta** ( );
Get the current disk transfer address.

long **Fcreate** (*const char *fname*, *short mode*);
Create file *fname* with mode *mode*.

long **Fdatime** (*DOSTIME *timeptr*, *short hdl*, *short rwflg*);
Get (*rwflag* = 0) or set (*rwflg* = 1) the time structure of the file associated by handle *hdl*.

long **Fdelete** (*const char *fname*);
Delete file with name *fname*.

long **Fdup** (*short handle*);
Return a second handle for a standart handle (0...5).

long **Fforce** (*short Hstd*, *short Hnew*);
Replace one of the standart handles (0...5) with *Hnew*.

long **Fopen** (*const char *fname*, *short mode*);
Open file *fname* with mode *mode*.

long **Fread** (*short handle*, *long cnt*, *void *buf*);
Read *cnt* bytes into *buf* from file assosiated with *handle*.

short **Frename** (*const char *old*, *const char *new*);
Change name of file from *old* to *new*. Also directories

long **Fseek** (*long pos*, *short handle*, *short whence*);
Set access pointer to position *pos* relative to *whence*.

void **Fsetdta** (*struct _dta *ptr*);
Set the current disk tranfer address to *ptr*.

long **Fsfirst** (*const char *filespec*, *short attr*);
Get first directory slot, which matches *filespec* and *attr*.

long **Fsnext** ( );
Get next match of search started by **Fsfirst**.

long **Fwrite** (*short handle*, *long cnt*, *const void *buf*);
Write *cnt* bytes from *buf* to file assosiated with *handle*.

long **Malloc** (*long size*);
Allocate *size* bytes of memory.

long **Mfree** (*void *ptr*);
Release block of memory.

long **Mshrink** (*long ptr*, *long size*);
Shrink size of memory block obtained by **Malloc**.

long **Pexec** (*short mode*, *const char *prog*, *const char *tail*, *char **env*);
Execute *prog* with mode *mode*. The following bits in the **a_ldflags** of the programm header modify behaviour:

Bit	Meaning
0	Fastload bit (clear only BSS)
1	load into fast ram (TT)
2	satisfy **Malloc**()s from fast ram (TT)
3...27	reserved
28...31	TPA size field (TT)

void **Pterm** (*short rv*);
Terminate current process with return value *rv*.

void **Pterm0** ( );
Terminate current and return to calling process.

void **Ptermres** (*long save*, *short ret*);
Terminate and stay resident, but keep *save* bytes of memory.

long **Super** (*void *stack*);
Inquire (*stack* = 1), set (*stack* = 0) or return from (*stack* > 0) supervisor mode.

short **Sversion** ( );
Get the version number of GEMDOS.

short **Tgetdate** ( );
Get the GEMDOS internal date. The harware clock is read in MEGA ST's.
The return value is composed of the following fields:

Bits	Meaning (Range)
0...4	Day (0...31)
5...8	Month (1...12)
9...15	Year (0...119)(+1980)

short **Tgettime** ( );
Get the GEMDOS internal time.
The return value is composed of the following fields:

Bits	Meaning (Range)
0...4	Seconds (0...29) have to be doubled
5...10	Minutes (0...59)
11...15	Hours (0...23)

long **Tsetdate** (*short date*);
Set the GEMDOS internal date.

long **Tsettime** (*short time*);
Set the GEMDOS internal time.

GEMDOS Calls unique to the TT

#include <osbind.h>

long **Maddalt** (*long start*, *long size*);
Extend the memory, which is managed by **Mxalloc**() and **Pexec**() with *size* bytes starting at address *start*.

void ***Mxalloc** (*long amount*, *short flag*);
Allocate *amount* bytes of memory from the OS pool. −1 for *amount* returns the max. size for an allocatable segment. *flag* defines were the memory is allocated.

Value	Meaning
0	alloc mem **only** in ST ram
1	alloc mem **only** in TT ram
2	alloc mem in ST ram, if possible
3	alloc mem in TT ram, if possible

GEMDOS Calls unique to MiNT

#include <mintbind.h>

long **Dclosedir** (*long dir*);
Close directory whose handle is *dir*.

LONG **Dcntl** (*word command*, *char *fdname*, *long argument*);
Perform a file system specific *command* upon file or directory *fdname*. *argument* depends on *command*.

int **Dlock** (*short mode*, *short drive*);
Lock (*mode* == 1) or unlock (*mode* == 0) the BIOS device *drive*.

long **Dopendir** (*char *dname*, *word flag*);
Open directory *dname* for reading and return a handle. *falg* determines mode (*flag* == 0 for "normal", *flag* == 1 for "compatibility" mode).

LONG **Dpathconf** (*char *name*, *WORD which*);
Return information about various limits/capabilities of the file system on which file *name* is located. The information returned depends upon *which* as follows:

Value	Meaning
−1	max. legal value for *which*
0	int. limit of open files
1	max. # of links to a file
2	max. len. of a full pathname
3	max. len. of an individuell file name
4	# of bytes written atomically
5	info about file name truncation

LONG **Dreaddir** (*word buflen*, *LONG dirhandle*, *char *buf*);
Return next entry from directory assosiated with *dirhandle* in buffer *buf* with length *buflen*.

LONG **Drewinddir** (*LONG dirhandle*);
Rewinds the open directory assosiated with *dirhandle*.

LONG **Fchmod** (*char *fname*, *WORD mode*);
The file access permissions of *fname* are changed according to *mode*.

LONG **Fchown** (*char *fname*, *WORD uid*, *WORD gid*);
The user and group ownership of *fname* are set to *uid* and *gid* respectivly. (TOS file system doesn't support a notion of ownership.

WORD **Fcntl** (*WORD fh*, *LONG arg*, *WORD cmd*);
Do file control commands on file handle *fh* of an open file. *cmd* and *arg* vary upon the file type of *fh* and the operation.

LONG **Fgetchar** (*WORD fh*, *WORD mode*);
Read a character from the file assosiated with handle *fh*. *mode* determines mode (cooked, raw, echo).

LONG **Finstat** (*WORD fh*);
Return the number of characters available for reading from file handle *fh*.

LONG **Flink** (*char *oldname*, *char *newname*);
The file name *newname* (a "hard link") for the file currently named *oldname* is created. (The TOS file system doesn't support links.)

LONG **Fmidipipe** (*WORD pid*, *WORD in*, *WORD out*);
Changes the GEMDOS Midi input and output handles for process with id *pid* to *in* and *out* .

LONG **Foutstat** (*WORD fh*);
Return the number of bytes, that may be written to file handle *fh* without blocking.

WORD **Fpipe** (*WORD usrh[2]*);
Create a pipe. *usrh[0]* is the read-only end and *usrh[1]* the write-only end file handle of the pipe.

LONG **Fputchar** (*WORD fh*, *LONG ch*, *WORD mode*);
Write a character to the file whose handle is *fh*. *mode* is as for **Fgetchar**.

LONG **Freadlink** (*WORD bufsiz*, *char *buf*, *char *lname*);
Returns in the buffer *buf* of size *bufsiz* the file name the symbolic link *lname* points to. (The TOS file system doesn't support symbolic links.)

WORD **Fselect** (*unsigned WORD timeout*, *LONG *rfds*, *LONG *wfds*, *((long)0)*);
Select file descriptors, that are ready for reading or writing. *timeout* is the number of milliseconds to wait before returning. A bit in one of the *[rw]fds* bitmaps, which is on, indicates the file descriptor to be tested.

LONG **Fsymlink** (*char *oldname*, *char *newname*);
The file name *newname* (a "soft link") for the file currently named *oldname* is created. (The TOS file system doesn't support symbolic links.)

LONG **Fxattr** (*WORD flag*, *char *fname*, *XATTR *xattr*);
For the file *fname*, the file attributes are obtained and stored in *xattr*. If *flag* == 0 a symbolic link is resolved, otherwise (*flag* == 1) the info is for the symbolic link itself.

void **Pause** ( );
Suspend the process until it receives a signal that is not being ignored and is not masked.

WORD **Pdomain** (*WORD newdom*);
If *newdom* is not −1, sets the process domain of the current process to *newdom*. Alway returns previous domain. Domain 0 is the TOS domain and the default; domain 1 is the MiNT domain.

LONG **Pfork** ( );
Create a new process, that is the duplicate of the current one, but has its own copy of the address space. The return value is 0 for the child, and the child's pid in the parent.

WORD **Pgetegid** ( );
WORD **Pgeteuid** ( );
Return the effective groud or user id's.

WORD **Pgetgid** ( );
WORD **Psetgid** (*WORD id*);
Get or set the group id of the current process.

WORD **Pgetpid** ( );
WORD **Pgetppid** ( );
WORD **Pgetpgrp** ( );
Get the currents process' process id, it's parent's process id, or its process group.

WORD **Pgetuid** ( );
WORD **Psetuid** (*WORD id*);
Return or set the user id under which the current process is running.

WORD **Pkill** (*WORD pid*, *WORD sig*);
Send signal *sig* to process with given *pid*. If *pid*== 0, the signal is sent to all proc's with the same process group.

LONG **Pmsg** (*WORD mode*, *LONG mbox*, *void *msg*);
WORD **Pnice** (*WORD delta*);
WORD **Prenice** (*word pid*, *word delta*);
void **Prusage** (*LONG rsp[8]*);
Get various resource information from the operating system.

Value	Meaning
r[0]	time spent in MiNT kernel
r[1]	time spent in proc's own code
r[2]	tot. kernel time for children
r[3]	tot. user code time for children
r[4]	memory alloc. for this proc.
r[5]-r[7]	reserved

Psemaphore (*short mode*, *long id*, *long tmout*);
LONG **Psetlimit** (*WORD lim*, *LONG val*);
Get/Set a resource limit for a process. The old limit is returned. If *val* is negativ, the limit is unchanged; 0 sets umlimited resource; any other value sets that limit. *lim* is defined as follows:

Value	Meaning
1	max. CPU for proc in milliseconds
2	max. memory allowed for proc.
3	limit of **Malloc**()'ed mem. for proc.

Psigaction (*short sig*, *long action*, *long oldaction*);
WORD **Psetpgrp** (*WORD pid*, *WORD newgrp*);
Set the process group of the process with given *pid* to *newgrp*.

LONG **Psigblock** (*unsigned LONG mask*);
Adds the signal in the 32 bit *mask* to the blocked set. The return value is the set of previously blocked signals. (Usage: **Psigblock**(1 << SIG#))

LONG **Psignal** (*WORD signal*, *(void*)(*handler)(LONGsig);
Installs a signal handler for the indicated *signal*. *handler* is the address of a function, that will be called, when the signal occurs.

LONG **Psigpending** ( );
Return a longword containing the signals, that have been sent to the process, but not yet handled.

LONG **Psigreturn** ( );
Prepare to exit from a signal handler. (only needed with **longjmp**())

LONG **Psigsetmask** (*unsigned LONG mask*);
Replaces the set of blocked signals with *mask*. The old set of blocked signals is returned.

Pumask (*short mask*);
LONG **Pusrval** (*LONG arg*);
Return the process specific user value for this process.

WORD **Pvfork** ( );
Creates a copy of the current process. Both child and parent share the same address space. The return value is 0 for the child, and the child's pid in the parent.

LONG **Pwait** ( );
Return the exit status of the children run asyncronously.

LONG **Pwait3** (*WORD flag*, *LONG *rusage*);
Wait for a child and return its exit status. If *rusage* is non zero, *rusage*[0] contains millisec's spend by child in user space and *rusage*[1] contains millisec's spent by child in kernel space.

WORD **Syield** ( );
Tell MiNT, that is okay to switch processes right now. Always returns 0.

LONG **Sysconf** (*WORD n*);
Return information about various limits/capabilities of the current version of MiNT. Possible values for *n* are:

Value	Meaning
−1	max. legal value for *n*
0	max. # of mem. regions per proc.
1	max. len. of Pexec command line
2	max. # of open files per proc.
3	# of suppl. group id's
4	# of procs per user

LONG **Talarm** (*LONG sec*);
Set an alarm to go off *sec* from now. If *sec*==*0* cancel any pending alarm.

BIOS Calls via Trap 13

#include <osbind.h>
Available devices for BIOS calls are:

Device	#	
_PRT	0	parallel port
_AUX	1	serial port
_CON	2	console
_MIDI	3	MIDI port
_IKBD	4	keyboard processor
_RAWCON	5	console (no terminal emulation)

long **Bconin** (*short dev*);
Read a character from device *dev*. (Allowed devices: 0...3

void **Bconout** (*short dev*, *short c*);
Write character *c* to device *dev*. (Allowed devices: 0...5)

short **Bconstat** (*short dev*);
Get the status of the input device *dev*. (Allowed devices: 1...3).

short **Bcostat** (*short dev*);
Get the status of the output device *dev*. (Allowed devices: 0...4)

long **Drvmap** ( );
Get the bitmap of available drives.

BPB ***Getbpb** (*short dev*);
Get the BIOS parameter block of device *dev*.

void **Getmpb** (*void *ptr*);
The memory parameter block pointed to by *ptr* is filled.

long **Kbshift** (*short mode*);
Get (*mode* = -1) or set the current keyboard status.

The return value is composed of the following fields:

Bit	Meaning
0	Right shift key
1	Left shift key
2	Control key
3	Alternate key
4	Caps lock key
5	r. mouse button (ClrHome)
6	l. mouse button (Insert)
7	Reserved (0)

short **Mediach** (*short dev*);
Check, if disk in device *dev* has changed.

short **Rwabs** (*short rwflag*, *long buf*, *short n*, *short sector*, *short dev*);
Read (*rwflag* = 0) or write (*rwflag* = 1) *n* logical sectors from device *dev*.

void (*)(void)Setexc(short vecnum, long vecptr);
Get (vecptr = -1) or set an M68000 exception vector.

long **Tickcal** ( );
Get the number of milliseconds between two calls of **tickcal**.

XBIOS Calls via Trap 14

#include <osbind.h>

void **Bioskeys** ( );
Reset to initial keyboard mapping tables.

short **Blitmode** (*short flag*);
Configure the blitter chip.

short **Cursconf** (*short rate*, *short attr*);
Configure the cursor and blinking speed.

void **Dosound** (*void *ptr*);
Output a number of bytes to the soundchip.

short **Floprd** (*void *buf*, *long filler*, *short drv*, *short sect*, *short trk*, *short side*, *short n*);
Read physically *n* sectors from floppy drive *drv*.

short **Flopwr** (*void *buf*, *long filler*, *short drv*, *short sect*, *short trk*, *short side*, *short n*);
Write physically *n* sectors to floppy drive *drv*.

short **Flopfmt** (*void *buf*, *long filler*, *short drv*, *short spt*, *short trk*, *short side*, *short i*, *long m*, *short v*);
Format track *trk* on drive *drv* with *spt* sectors per track.

short **Flopver** (*void *buf*, *long filler*, *short drv*, *short spt*, *short trk*, *short side*, *short n*);
Read a number of sectors and compare with memory.

short **Getrez** ( );
Get the current display resolution (0 = low, 1 = mid, 2 = high).

long **Gettime** ( );
Get the time from the hardware clock (lower word = time, upper word = date).

short **Giaccess** (*short data*, *short reg*);
Get or set a register of the GI sound chip. Set bit 8 of *reg* for write operation.

void **Ikbdws** (*short cnt*, *void *ptr*);
Write a sequence of *cnt*+1 bytes to the keyboard processor.

void **Initmous** (*short type*, *void *param*, *void *vptr*);
Initialize the mouse cursor routines.

IOREC ***Iorec** (*short ioDEV*);
Get a pointer to a device specific buffer.

void **Jdisint** (*short vnum*);
Disable interrupt *vnum* of the MFP 68901 chip.

void **Jenabint** (*short vnum*);
Enable interrupt *vnum* of the MFP 68901 chip.

KBDVECS ***Kbdvbase** ( );
Get a pointer to the KBDVECS structure.

short **Kbrate** (*short delay*, *short reprate*);
Get or set keyboard repeat rate.

KEYTAB ***Keytbl** (*void *nrml*, *void *shft*, *void *caps*);
Set the addresses of the keyboard mapping tables (-1 = don't change).

void ***Logbase** ( );
Get the start address of the logical display memory.

void **Mfpint** (*short vnum*, *void *vptr*);
Set the interrupt vectors of the MFP 68901 chip.

void **Midiws** (*short cnt*, *void *ptr*);
Write a sequence of *cnt*+1 bytes to the MIDI-port.

void **Offgibit** (*short ormask*);
Clear a bit in "PORT A" register of the GI chip.

void **Ongibit** (*short andmask*);
Set a bit in "PORT A" register of the GI chip.

void ***Physbase** ( );
Get the start address of the physical display memory.

void **Protobt** (*void *buf*, *long serial*, *short dsktyp*, *short exec*);
Create a boot sector in memory.

void **Prtblk** (*void *pblkptr*);
Special hardcopy routine, not unlike the **Scrdmp()** routine.

long **Random** ( );
Get a 24 bit random number.

long **Rsconf** (*short baud*, *short flow*, *short uc*, *short rs*, *short ts*, *short sc*);
Set the communication parameters for the serial port. The return value is the current configuration of the four register of the UART.

void **Scrdmp** ( );
Dump the current screen to the printer.

short **Setcolor** (*short colornum*, *short color*);
Get (*color* = -1) or set contents of color register.

void **Setpalette** (*void *palptr*);
Set the color palette of the video hardware.

short **Setprt** (*short config*);
Get or set the current printer configuration.
The bits of the return value are assigned as follows:

Bit	Off	On
0	Matrix-	Daisy Wheel printer
1	color	monochrom
2	Atari-	Epson printer
3	Draft-	High quality
4	Centronics-	RS232 interface
5	Endless	Single sheet paper

void **Setscreen** (*void *lscrn*, *void *pscrn*, *short rez*);
Set the logical and physical display memory start address and the current screen resolution.

void **Settime** (*long time_date*);
Set the hardware clock to *time_date*(lower word = time, upper word = date.

void ***Ssbrk** (*short size*);
Reserve *size* bytes at the end of the physical memory (Dummy routine in all TOS versions).

long **Supexec** (*void *funcptr*);
Execute a subroutine in supervisor mode.

void **Vsync** ( );
Wait until the verical blank interrupt has bitten.

void **Xbtimer** (*short timer*, *short ctrl*, *long data*, *void *vptr*);
Set and start the MFP 68901 timer.

XBIOS Calls unique to the TT

I don't have more information about this calls at the moment. Can someone please enlighten me.

#include <osbind.h>

long **Bconctl** (*short opcode*, *long operand*);

long **Bconmap** (*short dev*);

void **EgetPalette** (*short start*, *short count*, *word *palptr*);
Read parts or the complete TT color palette. Starting at register *start*, *count* words are transfered to the word field *palptr*.

short **EgetShift** ( );
Get the current contents of the videoshifter control register.

short **EsetBank** (*short bank*);
Immediatly activate one of the 16 TT color banks and copy the values to the ST(E) compatible color register.

short **EsetColor** (*short num*, *short val*);
Set color register *num* to the value *val*. If *val*== −1 the current value is returned.

short **EsetGray** (*short mode*);
Switch between color (*mode* == 0) and gray scale presentation.

void **EsetPalette** (*short start*, *short count*, *word *palptr*);
Change parts or the complete TT color palette. From the word field *palptr count* color register are set, starting at register *start*.

void **EsetShift** (*short mode*);
Set the videoshift control register and return the previous contents.

short **EsetSmear** (*short mode*);
If *mode*≠ 0, the sample & hold/smear mode is switched on.

LineA Calls

#include <linea.h>

void **linea0** ( );
Initialize lineA.

void **linea1** ( );
Put pixel.

int **linea2** ( );
Get pixel.

void **linea3** ( );
Draw line.

void **linea4** ( );
Horizontal line.

void **linea5** ( );
Draw rectangle.

void **linea6** ( );
Filled polygon.

void **linea7** (*BBPB *ptr*);
Bit blit.

void **linea8** ( );
Text blit.

void **linea9** ( );
Show mouse.

void **lineaa** ( );
Hide mouse.

void **lineab** ( );
Mouse form.

void **lineac** (*void *ptr*);
Undraw sprite.

void **linead** (*int x*, *int y*, *SFORM *sprite*, *void *ptr*);
Draw sprite.

void **lineae** ( );
Copy raster.

void **lineaf** ( );
Seed fill.

VT52 Escape Seqences

#include <vt52.h>

Mnemonic	Sequence	Meaning
C_UP	ESC A	cur. one line up
C_DOWN	ESC B	cur. one line down
C_RIGHT	ESC C	cur. one column right
C_LEFT	ESC D	cur. one column left
CLEAR_HOME	ESC E	clear screen, cur. home
HOME	ESC H	cur. home
SCROLL_UP	ESC I	cur. one line up (scroll)
CLEAR_DOWN	ESC J	clear to end of screen
DEL_EOL	ESC K	clear until end of line
INS_LINE	ESC L	insert line
DEL_LINE	ESC M	delete line
CURS_LOC	ESC Y%c%c	set cur. to position
CHAR_COLOR	ESC b%c	set char. color
BG_COLOR	ESC c%c	set background color
C_ON	ESC e	switch cur. on
C_OFF	ESC f	switch cur. off
C_SAVE	ESC j	store cur. position
C_RESTORE	ESC k	restore cur. position
ERASE_L	ESC l	clear cur. line
DEL_BOL	ESC o	clear until beg. of line
REV_ON	ESC p	inverse on
REV_OFF	ESC q	inverse off
WRAP_ON	ESC v	automatic line wrap on
WRAP_OFF	ESC w	automatic line wrap off

System Variables and Magic Numbers

Error Numbers

#include <errno.h>

ENOERR	0	no error
E_OK	ENOERR	
EERROR	1	generic error
EDRNRDY	2	drive not ready
EDRVNR	EDRNRDY	
EUKCMD	3	unknown command
EUNCMD	EUKCMD	
ECRC	4	crc error
E_CRC	ECRC	
EBADREQ	5	bad request
ESEEK	6	seek error
E_SEEK	ESEEK	
EUKMEDIA	7	unknown media
EMEDIA	EUKMEDIA	
ESECTOR	8	sector not found
ESECNF	ESECTOR	
EPAPER	9	no paper
EWRITE	10	write fault
EWRITEF	EWRITE	
EREAD	11	read fault
EREADF	EREAD	
EGENERIC	12	general mishap
EROFS	13	write protect
ECHMEDIA	14	media change
E_CHNG	ECHMEDIA	
EUKDEV	15	unknown device
EUNDEV	EUKDEV	
EBADSEC	16	bad sectors
ENBADSF	EBADSEC	
EIDISK	17	insert disk
EOTHER	EIDISK	
EINVAL	32	invalid function number
ENOENT	33	file not found
ESRCH	ENOENT	pid not found
EPATH	34	path not found
EMFILE	35	too many open files
EACCESS	36	access denied
EACCES	36	access denied
EPERM	EACCESS	
EBADF	37	invalid handle
ENOMEM	39	insufficient memory
EFAULT	40	invalid memory block request
ENXIO	46	invalid drive

EXDEV	48	cross device rename
ENMFILES	49	no more files (Fnext)
ENMFIL	ENMFILES	
ERANGE	62	range error
EDOM	63	domain error
EBADARG	64	range error /context unknown
EINTERNAL	65	internal error
EINTRN	EINTERNAL	
ENOEXEC	66	invalid program load format
EPLFMT	ENOEXEC	
ESBLOCK	67	set block failed/ growth restraints
EGSBF	ESBLOCK	
EEXIST	80	file exists (open)
ENAMETOOLONG	81	file exists (open)
ENOTTY	82	not a tty (ioctl)
EAGAIN	EDRNRDY	try again later
ENOTDIR	EPATH	* preliminary *
