YourFault

1.1 YourFault -- Replace error text

```
YourFault 1.2
Lee Kindness
Wangi!!
```

```
Spice up those error requesters...
```

```
Introduction      : An overview
Usage             : How to use YourFault
Quitting         : How to quit (!)
Notes            : Some extra information
To Do            : My Plans
Source           : Source code information
Thanks           : Some thanks
Contact          : Contact address.
Conditions       : Conditions and distribution
Version History  : History of the program
Other Programs   : Might want to try these
```

1.2 Introduction

YourFault is a small hack that lets you change the error messages returned by the system. You can replace each and every one with your own message. For example instead of

```
"Not a DOS disk"
```

you could replace it with

```
"Banana in drive"
```

```
WORKBENCH 2 IS REQUIRED. (of course...)
```

1.3 Usage

Firstly install it using the supplied script. YourFault will be activated the next time you reboot your Amiga.

Your fault reads the replacement error strings from a file specified by the Shell arguments or Workbench tooltypes:

```
Shell template: "FROM:"
```

```
Workbench Tooltypes: FROM
```

The option FROM defaults to "S:FaultStrings".

If YourFault beeps when run then it cannot find the specified strings file!

The strings file has the following format:

1. A '#', '|' or ';' in the first column of a line specifies a comment.
2. The actual data is in the form:
nnn:String
where "nnn" is the error number (these are documented in the supplied file) and "Strings" is the replacement error text.
3. It is recommended that replacement strings are less than 80 characters long.
4. If a possible error number is not redefined then the built in ROM error string is used.
5. A '^' specifies a newline... not really needed much.
6. If a error string by default (see DefFStrings) has '%ld', '%s' or similar tokens in it then you must preserve them in your replacement string (in the same order)
7. If a default error string has '^' in it then you are probably best to put a '^' in your replacement

The error requestors that dos puts up when a non-DOS disk is in the drive are built up from the INTERNAL_#? strings.

If you are in a hurry to see your improved error messages then type the following in a Shell:

```
Fault <number>
```

For example:

```
> fault 212  
Fault 212: Not the right type... doh!
```

YourFault is supplied with two example fault files:

1. FaultStrings -- Copied to S: by the install script
2. DefFStrings -- Equivalent strings to the English built-in.

You can create a default file for your local using the GetDefErrors command.

1.4 GetDefErrors

The supplied utility command "GetDefErrors" can be used to create a file containing the default error strings. This is useful because the default strings change with locale. You should quit or deactivate YourFault before using GetDefErrors.

To use GetDefErrors you simply launch it from a shell. It will then create a file called "DefErrors.fault" which will contain the error strings in a format usable by YourFault.

1.5 Quitting

To quit you can send a Ctrl-C break to YourFault, run it again and select quit or select "Remove" from the commodities exchange.

NOTE: If you here a beep after quitting then YourFault has been unable to free a jump table. This is because another program has patched the same functions. The method used in removing the patches makes this loss of memory necessary but it also makes the patch removal safe.

1.6 Notes

YourFault patches a private AmigaDOS function... so I make no guarantee that it will work with future versions of the operation system... dosPrivate5() is the function that is patched.

If you change your locale then you will have to quit YourFault and run it again.

1.7 Things To Do...

The following things may be added to YourFault:

1. Play a sound sample (via a daemon such as Upd or MSD) when an error report occurs.
2. Get a better icon...
3. Well... suggestions!

1.8 Source Code

SAS/C source code is in the src directory. This code is in the public domain, do with as you will... Read the source for more information. The source was initially based on the source of WBTitle by Mark Thomas, thanks ↔ Mark!

NOTE: dev/c/SFPatch.lha is required to compile this source.

1.9 Thanks

For the source code of WBTitle:
Mark Thomas

And hello to all on #amiga!

1.10 Contact

Please feel free to send comments, bug reports, suggestions, gifts... to:

snailmail:
Lee Kindness
8 Craigmarn Road
Portlethen Village
Aberdeen
AB1 4QR
SCOTLAND

email: (neither of the addresses currently work, but try them...)
cs1lk@sal.scms.rgu.ac.uk
cs2lk@sal.scms.rgu.ac.uk

IRC:
My nick is Wangi

If you send me a disk, SEA (or money to cover return postage), and a small gift then I will send you all of my programs.

If you create an interesting fault strings file then upload it to aminet!

I DID NOT WRITE YOURFAULT TO MAKE MONEY... SO PLEASE SEND YOUR COMMENTS :)

1.11 Conditions and Distribution

Disclaimer

~~~~~

I hereby reject any liability or responsibility for these or any other consequences from the use of YourFault whatsoever. This includes, but is not limited to, damage to your equipment, to your data,

---

personal injuries, financial loss or any other kinds of side effects. Although YourFault has been tested thoroughly on several different machines, I cannot rule out the possibility that YourFault

1. is somehow incompatible to your equipment
2. has bugs that show up on your equipment
3. does not do what it is supposed to do on your equipment
4. does not work with future versions of AmigaDOS.

It is your responsibility to take any precautions necessary to protect yourself from these or any other effects. I explicitly reject any liability or responsibility from the consequences of you using YourFault

Distribution  
~~~~~

YourFault may be freely distributed and copied, as long as the following conditions are fulfilled:

1. All parts of the program and the documentation must be complete. The distribution of single parts or incomplete subsets of the original distribution is forbidden.
2. If YourFault is to be included in a commercial distribution (including magazines) then I must be sent a copy of the product (or if it is a mag that I am subscribed to then an increase in subscription). It would be better if you contacted me beforehand to ensure you have the latest version. In any case full credit must be given within the program documentation or magazine.
3. If the included source code is used in another program then credit must be given in the documentation.

1.12 Version History

1.0 06.05.95
- Initial Version

1.1 28.05.95
- Now a commodity, can use cx to quit, disable.
- '#' and '|' now used as a comment in the strings file aswell as ';'
- Code now uses SFPatch.h (dev/c on aminet)
- Now supports Shell arguments and Workbench tooltypes, only one option (FROM) is currently recognised.
- Program will take less time to quit now... (due to using SFQ_WAIT in sfpatch.h)
- Fixed bug in replacement Fault(), was returning BOOL. Now returns LONG number of bytes copied as per the autodocs.
- New Icon... still quite rubbish but better than the last one. I would like to have a banana sticking out of a diskdrive as the icon but my drawing skills do not stretch that far... Icon any1 ??

- Added a strings file which is equivalent to the defaults.
- Added to the documentation.

1.2 07.06.95

- Removed the patches on Fault() and PrintFault()... now patches a private AmigaDOS function !! (dosPrivate5())
 - As a result of the above Fault(), PrintFault() and ErrorReport() are all patched because they all call dosPrivate5()
 - '^' now used as a newline marker in the fault strings file.
 - Program reduced in size (5648->4744)
 - Added GetDefErrors to the archive.
-
