

Introduction

This is technical reference documentation for the DocBook XSL Stylesheets; it documents (some of) the parameters, templates, and other elements of the stylesheets.

This reference describes the templates and parameters relevant to formatting EBNF markup.

This is not intended to be “user” documentation. It is provided for developers writing customization layers for the stylesheets, and for anyone who’s interested in “how it works”.

Although I am trying to be thorough, this documentation is known to be incomplete. Don’t forget to read the source, too :-) [] ::= Error: no ID for productionrecap linkend: .
