

#38 Subrecords and the After phase

Written by Dave Terry

Published Date January 10, 1988

A subrecord's after phase is generated only when its parent is accepted

Accepting a subrecord in the "full page" layout (input layout) will not generate an after phase at that time. After phases are generated for subrecords only when the parent record is accepted. An after phase is generated for every subrecord, whether it is in the current subselection or not, and whether it has been modified or not. This after phase is executed from the "multi-line" layout (included layout) and not from the "full page" layout.
