Use the Numeric field formats to format output for boolean values

When using an Integer field to store boolean values, it is possible to display the field in a two state "Yes" or "No", format by making use of the numeric field formatting capability of 4th Dimension.

When formatting a numeric field, one can specify up to three possible configurations for numeric field formats. You can describe a different format for the field to display when the value of the field is positive, negative, or zero.

Format your boolean field as follows:

Yes;;No

The Yes will be displayed with any positive value. The No will be displayed only if the field is zero.
