

Q: As recommended in the documentation, we turned on the <sup>a</sup>Network Time Standard<sup>o</sup> feature in NetInfoManager. Now one machine is our time server and all other machines are time clients. This is great, except that I can't set the time on the time server with the Preferences application. It tells me time service is running and I should click the <sup>a</sup>Synchronize<sup>o</sup> button. So, how do I set the time on the Network Time Server?

A: The only way to set the time on Network Time Servers is to use the **date** command from a shell. See the Unix man pages for more information on **date**. For more information see <sup>a</sup>Configuring Network Time Service<sup>o</sup> in Chapter 3 of the *NeXTSTEP Network and System Administration Manual*.
