Opener

docAPP.tiff ¬ $\Rightarrow$ **docPS_1.tiff ¬ docShar.tiff ¬**

. . .

docTar_2.tiff ¬ docZ_1.tiff ¬

o *To use other versions of utilities:*
    If you want to use another version of an archival command, check
it in the Opener_utils package for any NEXTSTEP customizations
to its makefile or source.   Once you have created a binary
executable you can:
    - put it in *Opener.app/*, **or**
    - edit *Opener.app/Opener.table* to make the path to it explicit, **or**
                    - put it in a well-known place and make sure that *Opener.app/*,
    which is typically searched first, does not contain a redundant
    command.

o *To add new file types:*
    The file `Opener.table` lists suffix/command pairs that are used
to identify and unpack various kinds of files.   You need to edit this
table, and add an icon for the new type:

add ...
- a line to *Opener.table*
- a utility in the Other Resources suitcase in *PB.project*
- an icon to the TIFF suitcase in *PB.project*
- suffixes to *types[]* in *Controller.m:-openRequest*

Please let Denise know if you find bugs or make changes appropriate for the next release.
