

Here are the patches to get postgres running under NEXTSTEP 3.x. They are split it in two parts. The first part (pg95-1.0pl14-NS_RnA.base.patch.gz) contains the patches against the base (pg95 1.0pl14) distribution; The second part (pg95-port-next.tar.gz) contains the backend/port/next directory.

R&A does not support postgres anymore, unless we are paid to do so. To get postgres running under NEXTSTEP, one needs these patches, as well as SysVIPC (System V semaphore and shared memory emulation). SysVIPC is free for educational use. For commercial use, a license is needed. SysVIPC is distributed by ftp.
