*One*Vision

Dialog, without frontier

*DigiScript*TM

*DigiServer*TM

*Imposition*TM

It's our goal...

... to provide software for securing workflows dealing with PS, PDF, and EPS files. Our software is the solution for all companies in the graphic arts industry, such as publishing houses, printing houses, prepress service bureaus, advertising agencies, and DTP studios - simply for everyone who gets in touch with digital data.

We can answer your demand for a fast, secure, and undisturbed production process with a seamless integration of our software products into your existing production environment.

We offer both interactive and automated solutions for securing your production workflow.

OV-*DigiScript*TM

for correct data formats

DigiScript opens, checks, and corrects the digital data from your customers and enables you to pass them along as error-free PostScript or PDF files to your production environment. It offers the capability to professionally amend image, text, and graphic elements without regard from which system environment the files originate. Rejected files from the OV-DigiServer application can also be corrected here.

Key Functions

- accepting and editing of EPS, PDF, separated and unseparated PostScript files
 - zoom factors up to 80,000%, may also be set in dpi (WYSIWYG)
 - professional processing of image, text, and graphic elements
 - changing colors for selected elements, selected pages, or entire documents
 - extraction of all embedded fonts
- = secure production by outputting clean PostScript data

OV-*DigiServer*TM

for automated processing

The DigiServer software solution enables you to proof data files from customers in PDF, EPS, AI, TIFF and PS format and to tune them to your individual production line. This ensures a fully automated and error free production process, from order entry to the final print. A log file gives you detailed information about the incoming files. Faulty files can be rejected. Necessary corrections and enhancements for image, text, and graphic can be done by DigiScript.

Key Functions

- automated interpretation of PDF, EPS, AI, TIFF, and separated and separated PS files
 - data formats independent of hardware architectures and applications
 - files containing PS errors are rejected before entering the production process and will not disturb your work-flow
 - automated order processing and controlling
 - logging of faulty data files, which can then be amended with DigiScript
- = securing your production line by writing clean PostScript data

OV-*Imposition*TM

for secure imposition

Combined with DigiScript and DigiServer, OneVision Imposition is a secure solution for imposing documents. No additional import filters are required. Both DigiScript and DigiServer allow you to use OneVision Imposition to impose documents from any hardware architecture and/or application making it possible to process data that has entered the production in PS, EPS, PDF, AI, or TIFF format. OneVision Imposition also supports OPI for faster turn-around times.

Key Functions

- no import filters required
- WYSIWYG screen display of imposed sheets with zoom factors up to 80,000% possible
- defining folding schemes using an integrated "Origami" function
- combining document files of different origin
- automatic sheet scaling of proof prints for any output device

= secure imposition by processing clean Post-Script data
