

# INTERNET TELEPHONY

Making that connection with this issue's article on Internet telephony (It's Cheap to Call, page 60) is an offering from Third World Publishing that goes by the name of Digiphone. The software is on a 30 day free trial, so talk really is cheap. There's software for Windows 95, Windows 3.1 and the Mac.

Digiphone offers a full-duplex, two-way phone conversation if you have a direct connection across the internet, as well as voice encryption for privacy, and an e-mail messaging system if the person you are calling does not reply.

Dial up the Digiphone web site on <http://www.digiphone.com> for more information.
