Software Development Lifecycle

Requirements Analysis - Overview

Tasks

Basic Activities of Software Requirements Analysis

Define the functional domain - what functions are to be performed?

Define the information domain - what is the flow of information in the system, what is the structure of that information, and what is the content of that information?

Partition the problem - what is the hierarchy of the problem?

Develop the logical view of the requirements - detail the functions and data

Develop the physical view of the requirements - detail the real-world forms of the functions and data

Common Problems Encountered During Requirements Analysis

general communications problems, including not understanding the problem, misinterpreting information, and missing information

acquiring pertinent information

handling problem complexity

accommodating changes that will occur during and after analysis

Beginning the Process

Hold a meeting!

**The Facilitated
Application
Specification
Technique (FAST)**

Example: The SafeHome System

A microprocessor-based home security system that protects against a number of undesirable events such as illegal entry, fire, flood, etc.

SafeHome will use sensors to detect each situation, can be programmed by the homeowner.

SafeHome will automatically telephone a monitoring agency when a situation is detected.

Problem Understanding

Step 1. Identify objects, operations, constraints, and performance criteria:

Objects

Smoke detectors
Window/door sensors
Motion detectors
Alarm
Control panel
Telephone numbers

Operations

Set/reset alarm
Monitor sensors
Dial phone
Program control panel

Constraints

Cost less than \$200
Easy to use
Direct dial to telephone

Performance Criteria

Display within 1 s of event
Prioritize event processing
Delay at least 1 min before dialing phone

Problem Understanding, Continued

Step 2. Develop "mini"-specification for each entry on each list

Object: Control Panel

Mounted on wall

Size 9x5 inches

Contains 12 key-pad and special keys

Diagram of panel

All user interaction through control panel

Used to enable and disable system

Software to provide interaction guidance, echo responses, etc.

Connected to all sensors

Problem Understanding, Continued

**Step 3. After much debate and list modifications,
create list of validation criteria**

Enter 200 random events and observe alarm responses

Ensure display resets on power up

**When phone numbers are entered with 555- prefix, ensure
telephone is *not* dialed**

Problem Definition

**Step 4. Write complete draft specification
using
results of steps 1-3**

Requirements Spec

Concepts of Analysis

Information Domain:

- 1. Information flow**
- 2. Information content**
- 3. Information structure**

Modeling: Pictorial representation of problem solution

Aids analyst in understanding problem

Focal point of review

Foundation for design

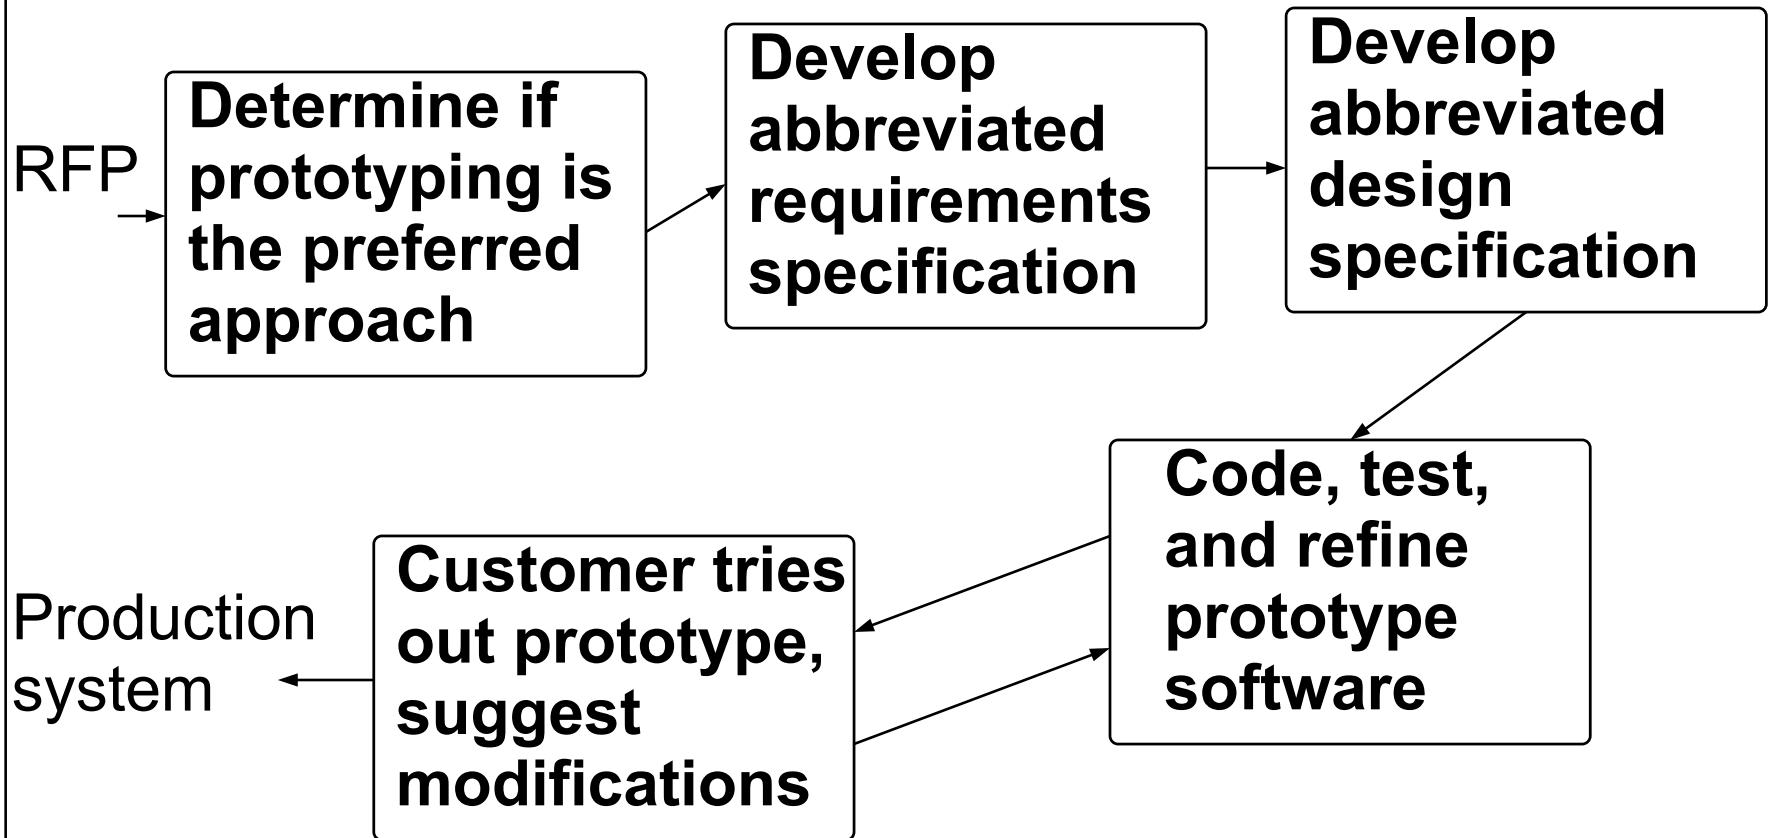

Partitioning: Break big problems into little ones

Software Views

<u>View</u>	<u>Focus</u>
Informational	Data
Functional	Functions
Behavioral	Execution process

Software Prototyping

Assume a request for proposal (RFP) or system spec defines the problem.

Specification Principles

Separate functionality from implementation - describe what is desired, not how

Understand the system of which the software is a part and the environment in which the system resides

Develop a cognitive model rather than a design or implementation model, and keep the perspective of the user

View the specification as a model, see if it is adequate to determine if a proposed implementation is satisfactory, and tolerate incompleteness

Localize and loosely couple the specification

Software Requirements Analysis (SRA)

Common Characteristics of the Methodologies

They perform information domain analysis

They have a means to represent functions

They can define interfaces

They support partitioning of the problem

They support abstraction

They can represent both the physical and logical views of the problem
