- Most software is custom-built, rather than being assembled from existing components.

- Software is a *business opportunity*.

- **Software frameworks evolve to handle larger and multiprogram systems**

- **Heavy dependence on graphics interfaces**

- **Artificial intelligence and neural computing become useful**

- **National computing motivates huge software systems**

Industrial View

- **Why does it take so long to finish a working software system?**

- **Why are development costs so high?**

- **Why can't we find all software errors before software is delivered?**

- **How can we measure the progress of software development?**

PROBLEMS WITH SOFTWARE DEVELOPMENT

✓ **Problems**

✓ **Causes**

Problems

1. We have little data on the software development process.

2. Customers are often dissatisfied with the software they get.

3. Software quality is hard to define and measure.

4. Existing software is often very difficult to maintain.

Can these problems be overcome?

Causes

- **No spare parts to replace, so an error in the original software is also in every copy.**

- **Software quality is a human problem.**

- **Project managers often have no software development experience.**

- **Software developers often have little or no formal training in engineering the development of the software product.**

- **Resistance to change from programming as an art to programming as an engineering task can be significant.**

SOFTWARE MYTHS

✓ **Customer Myths**

✓ **Developer Myths**

✓ **Management Myths**

Customer Myths

Myth	*Reality*
● A general statement of objectives is enough to get going. Fill in the details later.	● Poor up-front definition of the requirements is *THE* major cause of poor and late software.
● Project requirements continually change, but change can be easily accommodated because software is flexible.	● Cost of the change to software in order to fix an error increases dramatically in later phases of the life of the software.

Cost to Change

Definition	Development	Maintenance
1x	1.5-6x	60-100x
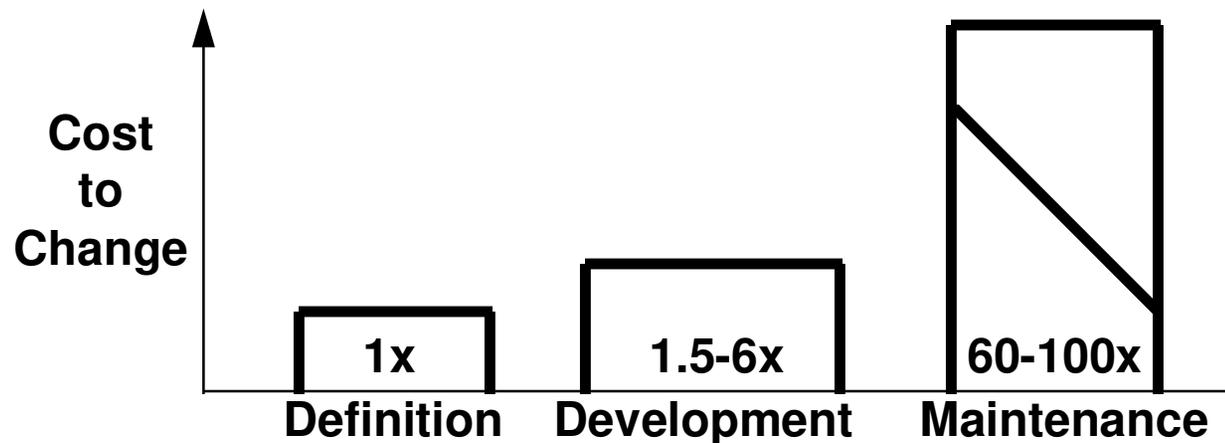

Developer Myths

Myth

- Once a program is written and works, the developer's job is done.

- Until a program is running, there is no way to assess its quality.

- The only deliverable for a successful project is a working program.

Reality

- 50%-70% of the effort expended on a program occurs after it is delivered to the customer.

- Software reviews can be more effective in finding errors than testing for certain classes of errors.

- A software configuration includes documentation, regeneration files, test input data, and test results data.

Management Myths

Myth	*Reality*
● Books of standards exist in -house so software will be developed satisfactorily.	● Books may exist, but they are usually not up to date and not used.
● Computers and software tools that are available in-house are sufficient.	● CASE tools are needed but are not usually obtained or used.
● We can always add more programmers if the project gets behind.	● "Adding people to a late software project makes it later." -- *Brooks*

Software Engineering Capability and Its Measurement

● The maturity of an organization's software engineering capability can be measured in terms of the degree to which the outcome of the process by which software is developed can be predicted.

   ❍ Predict the amount of time required to develop a software artifact

   ❍ Predict the resources (number of people, amount of disk space, *etc.*) required to develop a software artifact

   ❍ Predict the cost of developing a software artifact

● The *process* and the *technology* go hand in hand.

● One method of measurement is the *Capability Maturity Model for Software* developed by the Software Engineering Institute.

Ada Technology

● *Ada* is a computer programming language specifically designed to support software engineering.

● Some of Ada's features include:

  ❍ All of the normal constructs for looping, branching, flow control, and subprogram construction

  ❍ Support for enumeration types, integers, floating point, fixed point, characters, strings, arrays, records, and user-defined data types

  ❍ Support for algorithm templates (called generics) which allow algorithms to be expressed without concern for the kind of data on which the algorithm is applied

  ❍ Support for interrupts and concurrent processing

  ❍ Support for low-level control, such as memory allocation

● Ada is a *design* language as well as a *programming* language.

● Ada is designed to be read by Ada programmers and non-programmers.

   type Device is private;

   -- Abstract concept of a sensor

   -- Associate a sensor with memory

   function Read(S : in Device)

        return Integer;

   -- Return sensed value

```

Ada Technology

- **From the software engineering perspective, Ada helps by acting as something much more than a programming language; Ada can be used as a common language for communicating:**

  ○ **Some aspects of the requirements**

  ○ **Some aspects of the design**

  ○ **All aspects of the code**

- **In particular, by using Ada as a *design language*, code is simply realized as a complete, detailed elaboration of a design.**

- **For large, multi-person teams, Ada can be used as an exact, precise way to communicate requirements and design information -- often in a form which may be syntactically checked by a compiler. Ada is much better than conventional English in this regard.**

SOFTWARE COMPLEXITY, OBJECT-ORIENTED REQUIREMENTS ANALYSIS (OORA), AND OBJECT-ORIENTED DESIGN (OOD)

✓ **The Inherent Complexity of Software**

✓ **The Attributes of Complex Systems**

✓ **Canonical Form of a Complex System**

✓ **Bringing Order to Chaos**

✓ **On Designing Complex Systems**

The Inherent Complexity of Software

A *simple* software system is:

- completely specified or nearly so with a small set of behaviors

- completely understandable by a single person

- one that we can afford to throw away and replace with entirely new software when it comes time to repair them or extend their functionality

A *complex* software system (*industrial-strength software*) is:

- one which exhibits a rich set of behaviors

- extremely difficult, if not impossible, for an individual to comprehend all of its aspects - exceeds the average human intellectual capacity

- one that we can NOT afford to throw away and replace with entirely new software, so we patch it, maintain out-of-date development environments for it, and carefully control changes to it and its operational environment

The Attributes of Complex Systems

1. **A complex system is implemented in a hierarchical structure.**

2. **The determination of this hierarchy, selecting upper-level subsystems, lower-level subsystems, and primitive components, is relatively arbitrary, largely up to the discretion of the designer of the system.**

3. **Linkages within the components of a system are usually stronger than linkages between the components of a system.**

4. **Complex systems are often composed of only a few different classes of subsystems, although there may be many instances of each class.**

5. **Working complex systems have invariably evolved from working simpler systems. A complex system designed from scratch has never worked and cannot be patched to make it work.**

Canonical Form of a Complex System

Objects

Classes

Class Structure = "kind of" hierarchy
Object Structure = "part of" hierarchy
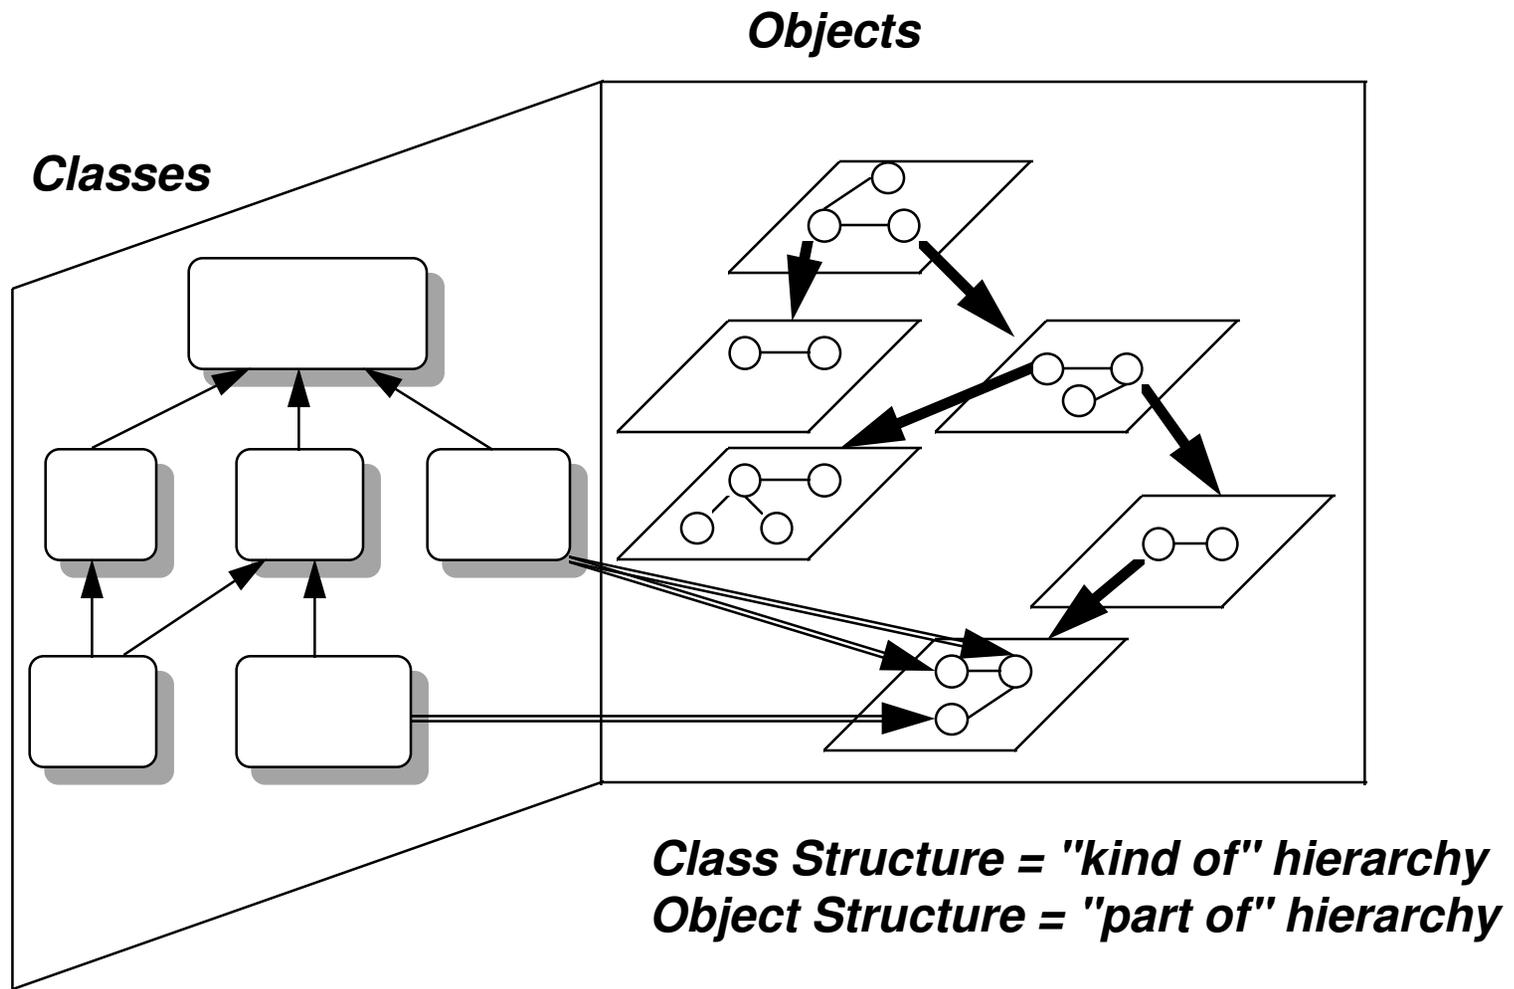

Bringing Order to Chaos

Decomposition

Abstraction and Hierarchy

Algorithmic

Object-Oriented

The Role of Abstraction

- Reducing the number of concepts to comprehend concurrently

- 7 +/- 2

The Role of Hierarchy

- Understanding the relationships between entities (object structure)

- Understanding the redundancy in the entities (class structure)

The Role of Decomposition

- "Divide and Conquer"

- Break a large system into a number of smaller subsystems and so on until the subsystems are manageable and understandable

- Two views: algorithmic and object-oriented

On Designing Complex Systems

Requirements Analysis - the disciplined approach used to understand a problem

Design - the disciplined approach used to devise a solution to a problem

The Purpose of Design

To construct a system that:

- satisfies a given specification

- conforms to limitations of the target

- meets constraints on performance and resource usage

- satisfies a given set of design criteria on the artifact

- satisfies restrictions on the design process itself, such as cost and schedule

Elements of Design

Notation - the language of expression

Process - the steps taken for the orderly construction of the design

Tools - the artifacts that support the design process by reducing the level of effort
