

CPSI Fixer XTension

CPSI Fixer is XTensions™ software that should correct a printing problem you may have experienced using QuarkXPress™ and certain affected PostScript Level 2 Configurable PostScript Interpreter (CPSI) printers. When this problem occurs, a portion of an imported EPS file that is cropped by a picture box on-screen does not crop in the printed output. While the software is designed primarily to resolve EPS clipping problems, it should fix clipping problems you may experience with other graphic formats.

Installation

To install the software, quit QuarkXPress. Copy the CPSIFix.XNT into the XTension folder inside your QuarkXPress folder and launch QuarkXPress. CPSI Fixer adds the **Use CPSI Fixer** command to the **Utilities** menu.

Notes

Use CPSI Fixer only with CPSI devices that produce the EPS clipping problem described above. You may experience significantly slower processing times when printing if you use this software with unaffected CPSI devices.

We have tested this software and believe that it solves the problem described above. However, Quark, Inc., does not warrant that QuarkXPress will operate uninterrupted or error-free with this software installed.
