

Win32s is a Microsoft® program designed for Windows® 3.1* which allows you to run certain 32-bit programs (programs for Windows® 95 or Windows® NT) on a 16-bit "operating system" (Windows® 3.1*).

In order to run TSRDemo.exe on Windows® 3.1*, you must have a recent release of Win32s installed on your system.

(If you are not sure if you already have Win32s, look for a Win32s folder in your Windows folder. Example: C:\Windows\System\Win32s).

If you do not have Win32s installed on your system:

Installing Win32s (or Ole32s):

- 1) Start Windows®.
- 2) From the file manager, look in the folder named "disk1" (The "disk1" folder is probably in the same folder as this Readme file).
- 3) From the "disk1" folder, run Setup.exe
- 4) Follow on-screen instructions.

If you already have Win32s installed on your system:

Try running TSRDemo.exe

If TSRDemo.exe does not run, or if some parts of the program do not run, you may need to update to a newer version of Win32s.

Replacing your old Win32s:

Note: Removing your old Win32s could cause problems. Do so at your own risk.

- 1) Delete your old Win32s folder. It can be found in your Windows\System\ folder.
- 2) If you deleted the Win32s folder from within Windows®, **you must re-start Windows® at this point.**
- 3) When Windows® tries to re-start, there will be a warning in which you are asked to check your system.ini file. Press any key.
- 4) From the file manager, look in the folder named "disk1" (The "disk1" folder is probably in the same folder as this Readme file).
- 5) From the "disk1" folder, run Setup.exe
- 6) Follow on-screen instructions.
