

# Atomikos Webservers

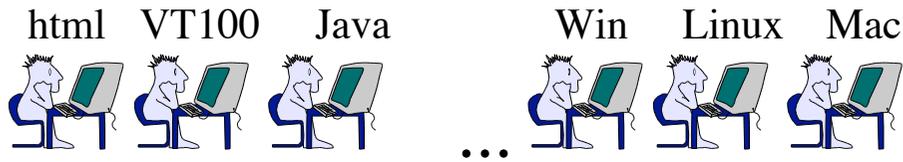

**TransactionsJTA:  
Portals to Backend Systems**

# Distribution is a Fact...

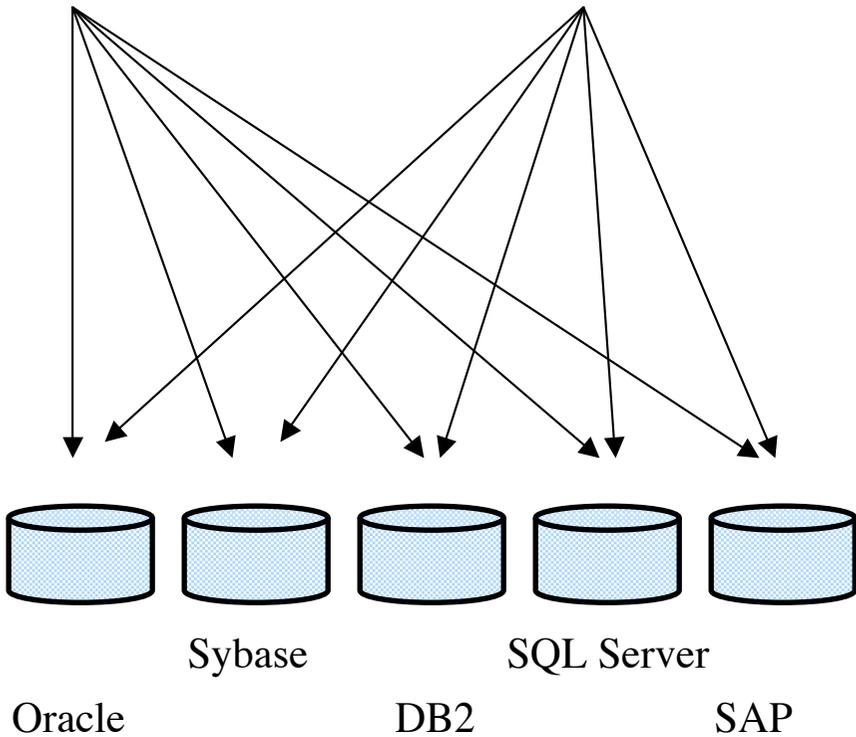

- **Different systems usually exist:**
  - different departmental policies
  - mergers of different companies
- **Cost-saving dictates integration:**
  - maximize ROI
  - leverage previous investments in hardware, licenses and data

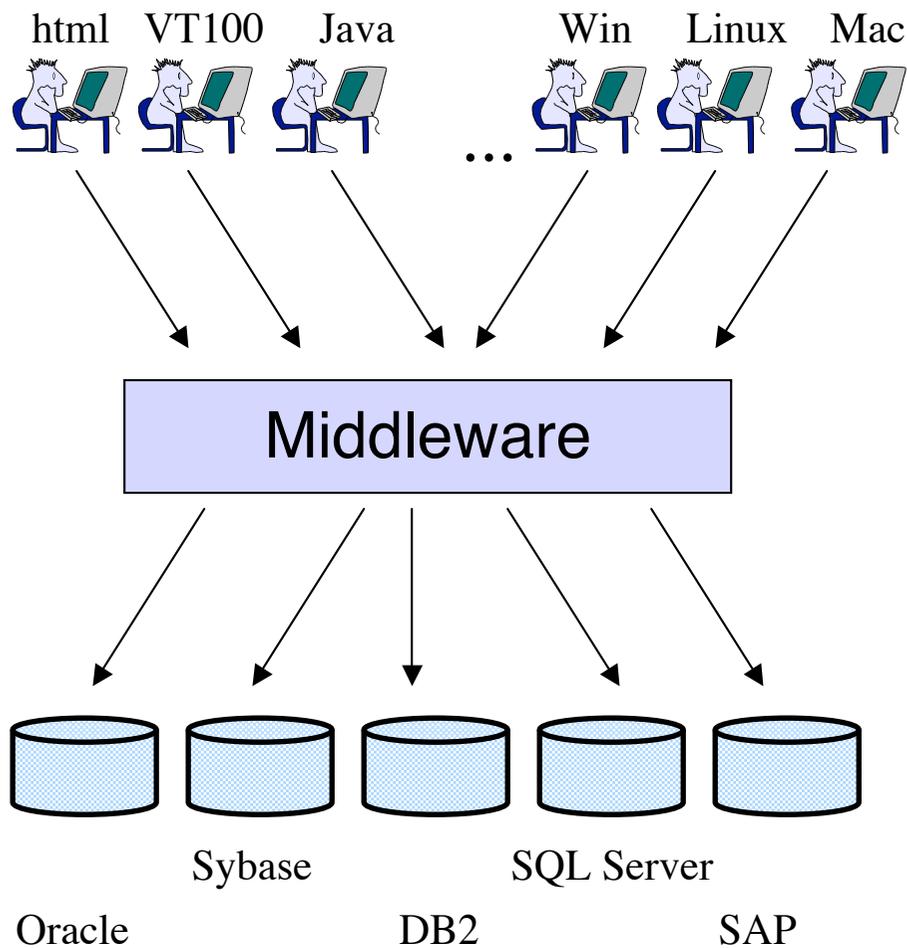

# Integration: The Naive Way

- **Example: 6 different client platforms for 5 server platforms**
- **Connecting each client to each server requires  $6 \times 5 = 30$  software modules**
- **This is hard to get, manage and maintain**

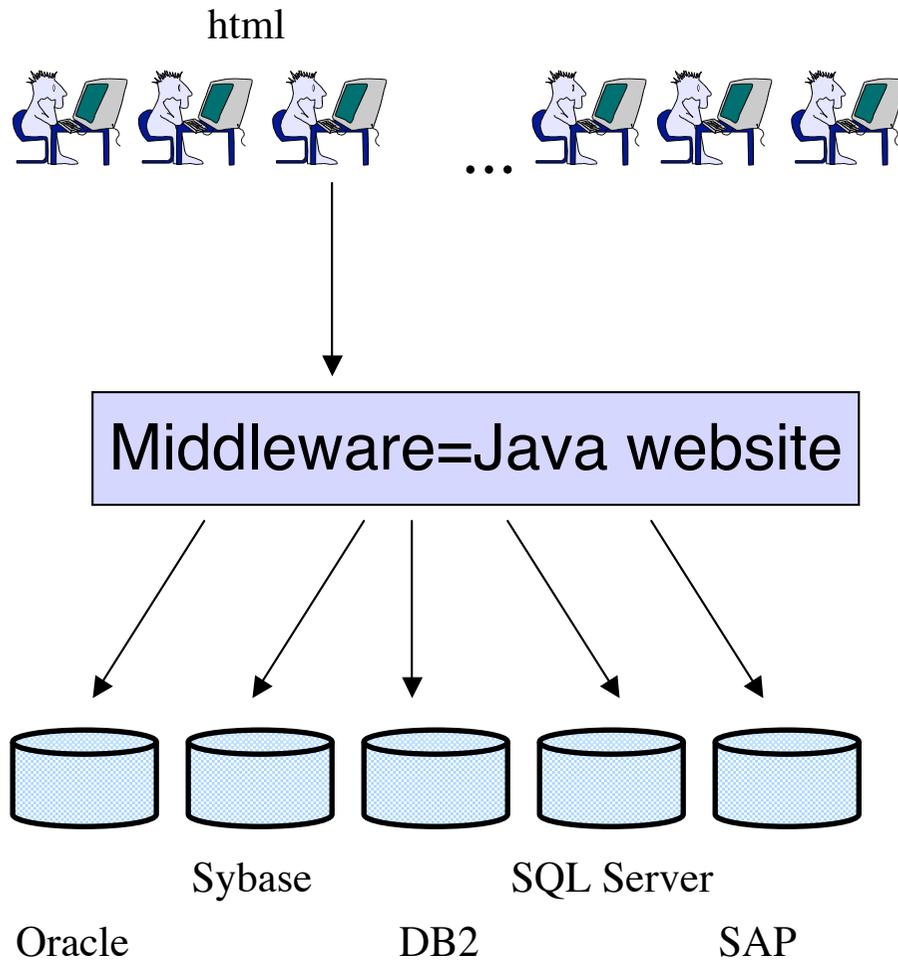

# Solution: Middleware

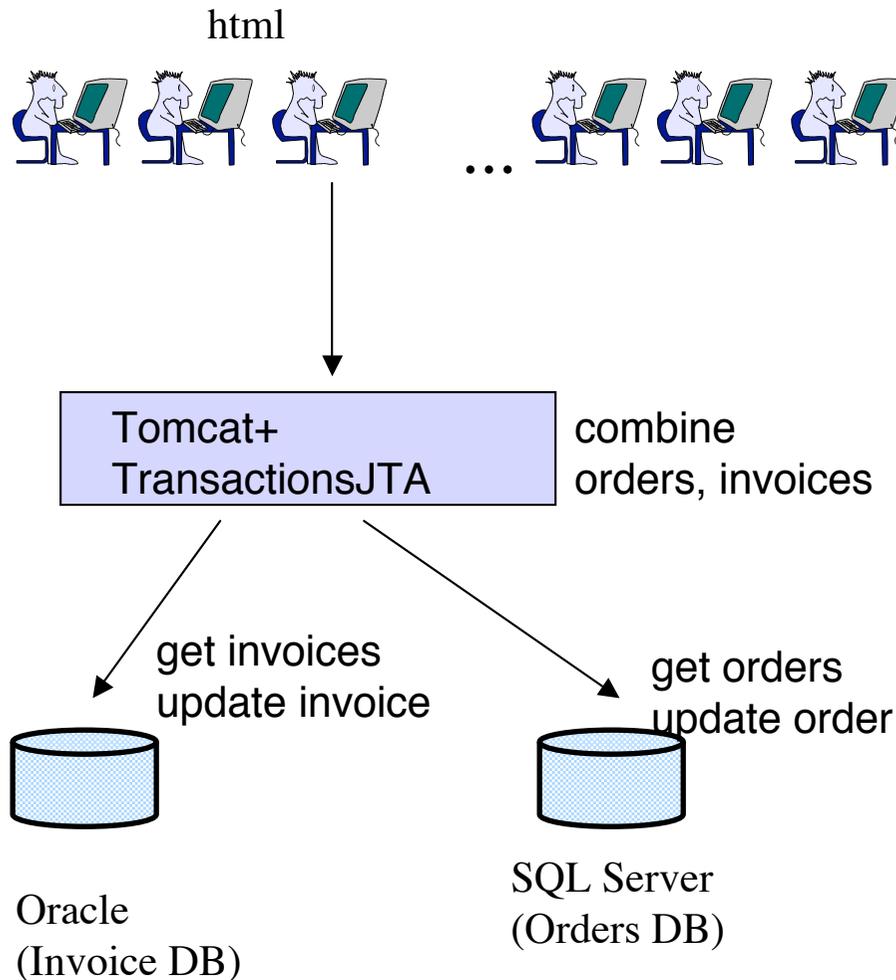

- **Put a system in the middle**
- **6 Clients for 1 Middle Layer**
- **5 servers for 1 Middle Layer**
- **Only 1 interconnection module is needed per client**
- **Only 1 interconnection module is needed per server**
- **The complexity is now only  $6+5=11$**

# Java Website: Zero Installation Middleware

- **The middle layer can be a Java (J2EE) webserver**
  - Programmed with Java plug-ins and web pages
- **Web access: clients need no new software!**
  - Browsers are everywhere already
  - No special browser needed, despite the Java webserver!!!
- **This again reduces installation and maintenance costs**
  - Only 5 modules are needed
  - No custom installation needed for the clients
  - Maintenance is limited to the server

# Java Website: Integration Portal

- **The middle layer can combine information from many existing databases**
  - This is what the java plug-ins do
  - Java has a standard programming model for this
  - Java has standard connectivity to the backend systems
  - *Java websites can be installed on any J2EE platform, not just TransactionsJTA!*
- **TransactionsJTA ensures back-end data consistency**
  - Missing piece in many J2EE servers!
  - Not shipped-in with Tomcat, Jetty or JBoss
  - Only partially available in much more expensive products

# TransactionsJTA

- **Based on open-source Java webserver**
  - Tomcat
  - Jetty
  - ...
- **TransactionsJTA adds support for multi-access transactions**
  - Needed for J2EE best practice programming schemes
- **TransactionsJTA makes these products robust**
  - Crash recovery
  - Fault-tolerance
- **TransactionsJTA maintains your data consistent!**
  - within each system
  - across different systems
  - across any type of crash
- **TransactionsJTA requires no specific changes in the Java code**
  - We increase your service quality behind the scenes!
- **Patented technology**

---

# Building a Website from Scratch?

- **For new websites, there are no existing back-ends**
  - Why not do all in Oracle or SQLServer?
  - Because these will be the departmental systems of tomorrow!
- **Adopting the J2EE architecture will allow you to include future systems**
  - Separate the integration logic (Java webserver) and the back-end logic (database content)
    - Allows Oracle and SQLServer extensions to be integrated later!
  - Explicitly adopt the integration-capable J2EE architecture
  - Benefit from open-source
  - With reliability and robustness added by Atomikos
  - But fullyJ2EE-standards-compliant
