

# System Accounting Enabling

235127\_PixelRule.tiff ↗

(This article comes from the Staying Secure by Marc Majka from NeXT Software Inc.)

## *Enable login and process auditing.*

Login and process accounting add to security by allowing you to detect and trace unauthorized activities on your computer. The presence of an accounting system can act as a deterrent as well.

To enable login accounting, create a file named **/usr/adm/wtmp**. Then, use the **last** and **ac** commands to display login reports and summaries.

To enable process accounting, create an accounting file with the command:

```
touch /usr/adm/acct
```

Then, start the accounting program **accton** during startup with the command:

```
/usr/etc/accton /usr/adm/acct
```

You can then use the **lastcomm** and **sa** commands to print process reports and summaries.

To accomplish this all automatically, you can add something like the following lines to the system startup file, **/etc/rc.local**:

```
if [ -f /usr/etc/accton -a -f /usr/adm/acct ]; then
/usr/etc/accton /usr/adm/acct
(echo " accounting") > /dev/console
fi
```
