

# 0.6 Release Notes:

## PropertyEdit

Enhancements include the following:

- ***Document Window***

Removed the top text field. Editing is now done in the browser, double click any cell to select it for editing. Moving towards a tool bar look with the controls at the top. Also making room for NT style menu.

509069\_paste.tiff ↗

- ***Split View***

Split view now remembers last position. Any subsequently opened documents will display the split view bar in the new location.

- ***Save new file***

Saving a new file will have "plist" automatically appended as the extension.

- ***Browser Cells***

Cells are set scrollable to fully support editing.

- ***New file Icon:***

*paste.tiff* ↵

## **Fixed Bugs:**

- ***Refresh***

You may have noticed that using the refresh feature caused crashes. Refresh is used when an edit made in the lower text view of the split view should be incorporated into the PropertyList. An immutable property was being created when a mutable one was needed. This is no longer a problem.
