0.4 Release Notes: PropertyEdit

Enhancements include the following:

- *Document Window*

The main doc window has been revised a bit.   There is a new text view to allow simultaneous property viewing in the standard format and in the browser format.   The browser and text view are separated by a split view.   In general, I have given this window a face lift that you can inspect for yourself.

- *New View Format*

The property list can be veiwed in both a browse and text format, connected by a split view.   There are controls below the text view which control how the text view behaves.

* Selected Branch - this displays only the branch selected.
* Whole Tree - this keeps the entire tree visible in the text view.
* Refresh - if you edit something in the text view, hit refresh to update the browser.

NOTE: Without hitting refresh, the document never reflects changes made in the text view.   Consequently, saves will also fail to capture these changes, so hit refresh to include changes made in the text view.

- Preferences

A control to handle text viewing configuration has been added.

This switch, labeled Lock Stepped, tells the document   to keep the browser and text view forever in sync.   This means when you change the selection in your browser, the text displayed also changes to reflect the new selection.   However, if you disable the lock stepping, the text displayed will change only when you click the Selected Branch or Whole Tree radio buttons.

- Miscellaneous Fixes

Other bugs and gliches were fixed.
