

setColor:forKey:  
colorForKey:

(NSColor \*)colorForKey:(NSString \*)defaultName

Invokes stringForKey: with key defaultName and uses the retrieved string to recreate the color object. This method uses NSColors colorWithStringRepresentation: method which has to ensure that decoding of NSColor subclasses is handled properly.

(void)setColor:(NSColor \*)aColor forKey:(NSString \*)defaultName

Uses setObject:forKey: to set the string value return by aColor's stringRepresentation method.
