

Changes (2.0.2 to 2.0.3)

The following changes have been made since the last release:

- Fixed bug in MiscSocket that prevented re-initting from working properly.
- Added MiscMutableData object.
- Added MiscCoord Additions category. It is in MiscAppKit, but probably really belongs in the MiscGSKit in the Foundation framework. The trouble is that it uses NSPoints, which are AppKit specific. What to do... I'm of a mind to define NSPoint (wrapped with #ifdefs to assure that it isn't defined already) in the MiscFoundation, since it isn't the sort of thing that is completely tied to interfaces...
- New methods in the NSString MiscExtensions category.

- Carl Lindberg's Regex stuff into the kit proper now.
- New stuff in the Temp area.
- Minor tweaks here and there.
