

RELEASE NOTES

August 1996

First OpenStep Compliant Release

Besides becoming OpenStep compliant (and more OpenStep-like with everything now more strongly typed) there were other API changes/additions.

CardPileView

Added **setMaxVisibleCards** and **maxVisibleCards** so you can now set the maximum visible number of cards at any one time. (thanks to David Fedchenko).

CardPile

Changed **cardAt:** to be **cardAtIndex:** so it's more like NSArray's methods.

Changed **cardIndex:** to **indexOfCard:** so it's more like NSArray's methods.

Added **topCard** and **bottomCard** to get the top and bottom card respectively.

Added **dealTopCard** which gives you the top card and removes it from the CardPile (thanks to Erik Kraft).
Removed **freeCards** because the existing method **empty** now does the exact same thing.
Changed **returnSize** to **cardSize** (don't know why it was named returnSize in the first place).

Card

Added some comparison methods: **isEqual:**, **isOneLargerThan:** and **isOneSmallerThan:**. (thanks again to David Fedchenko)

Other minor changes included moving all the current documentation for the classes in CardSet into the code itself so that Adam Swift's autodoc could be used to generate documentation. This will come in handy any time the classes change or are extended. This was much easier than it would have been to just change the documentation to reflect all the changes that happened.
