

TODO

1. Replace the gray stuff with color calls.
2. Check if any of the `getEditorClass` stuff now works in IB. (it doesn't as of the gamma release)
3. Clean up the rest of the documentation (autodoc compatible).
4. Clean up the rest of the code.
5. The trick in IB where you could click on the title or alternate title (if the button's state was one) and change the title no longer works. If you are on the right side (alternate side) and you change the title it actually changes the left side.

OTHER INTERESTING THINGS THAT I'LL PROBABLY NEVER DO

1. Implement `MiscArrowButtonCell` as three embedded cells... two `NSCells` for drawing the titles and a new `MiscArrowCell` for just drawing the arrow. That way you could use the `MiscArrowCell` in other views if you so desired. It would also be easier to implement an arrow button with a title on top and the alternate title on the bottom of the button.
