Introduction

235127_PixelRule.tiff ¬

LoginStats was born from the need to know who was logged into my computer and who logged in that day.

It can give you other interesting information about who and how much time users were using the computer. I think it's very useful and hope you think so too.

Please note that this application is simply a front end for the unix "ac" and "last" commands. With some added features.

Features:

Ported to OpenStep.

I have added commands to be able to track what programs are or have been executed on the machine. In order to do this you need to enable the system accounting on your system.

I added the "sa" button that will display system accounting information for every process that has been executed and also another button with the "-m" option which will print number of processes and number of CPU minutes for each user.

I have also added "lastcomm" which gives information on previously executed commands.

I hope you like LoginStats!

Thank you.
