MiscMMAView

Inherits From:	MiscPSView
Declared In:	MiscMMAView.h

Class Description

The MiscMMAView class defines a view that will draw itself using PostScript commands supplied by the Mathematica application.   Mathematica supports the ability to produce a PostScript description of its graphic renderings of mathematical expressions.   The resulting description uses many context dependent PostScript definitions that Mathematica usually handles internally.   The MiscMMAView class supports these definitions and the interpretation of Mathematica's PostScript representations.

MiscMMAView is a subclass of MiscPSView and overrides **writePSPreambleInContext:** to declare the Mathematica specific Postscript definitions.
