MiscDragging Release 1.0 - Alpha release

This is the initial release of the MiscDragging classes. They should be considered of alpha quality and have been submitted early to give developers that use the MiscKit an idea of what will replace the dragging classes that were part of the MiscKit1.x.y. The API in the next release is subject to change (though it probably won't too much). If you have any suggestions after checking out the dragging classes, please send me a note.

Known Problems
   · There isn't an Interface Builder palette yet. A future release will include it.
   · The objects haven't been completely tested with all the options. They seem to work fine in the default configuration, but setting all the options (especially in MiscDragCell) hasn't been thoroughly tested.
   · Documentation is still somewhat sparse.
   · There are no delegate methods for MiscDragView (or any other classes) yet.
   · Launching isn't implemented yet in MiscFileDragCell.
   · Editing titles of cells isn't implemented yet.
   · Multiline titles (like Digital Librarian does) isn't implemented yet.
