TD: TreeDiagram "Alpha-Light"

TD

TD is a test-bed for the **MiscTreeDiagram** framework. The framework will be used in **TreeDiagram** (previously **Wood**) and is part of the MiscKit. I called TD the alpha-light version of TreeDiagram because it's not really a alpha version of TreeDiagram. There's alot still missing (multiple documents, saving, exporting and importing, etc...).

So what is it good for now ? Not much :-). But in a way it can already do more than Wood could:

- horizontal and vertical trees
- node resizing and rearranging of siblings (rearrange siblings by control-dragging them)
- drag and drop of colors and styles
- much more to undo/redo

It's a better engine and it's written cleanly as a future framework with documentation and so on...

Here's some help on how to use the control panel in TD :

TDControls.eps.tiff ,
