

Q: As recommended in the documentation, we turned on the ^aNetwork Time Standard^o feature in NetInfoManager. Now one machine is our time server and all other machines are time clients. This is great, except that I can't set the time on the time server with the Preferences application. It tells me time service is running and I should click the ^aSynchronize^o button. So, how do I set the time on the Network Time Server?

A: The only way to set the time on Network Time Servers is to use the **date** command from a shell. See the Unix man pages for more information on **date**. For more information see ^aConfiguring Network Time Service^o in Chapter 3 of the *NeXTSTEP Network and System Administration Manual*.
