

2.2 X (4/8/2002, 10:50 AM)

- An OS X version! Finally!
- I removed the Welcome window in the X version, it just didn't feel right.

2.1 (10/17/2001, 6:58 PM)

- Various interface changes were made in preparation for an OS X release.
- Fixed a number of small bugs.
- MacDICT now uses my new HTTP socket, BasicHTTP.
- Added a "Create Links" option that highlights words that are linked to other definitions.
- Added an "Access Control" feature that allows you to exclude certain databases from results(for parents & schools).
- Added an "Export to Clipboard" feature, which as the name suggests, produces the same text as "Export to File", but places it in the clipboard.
- Rebuilt MacDICT with the newest version of REALBasic, 3.5.1
- A new CSM(v1.1.1) is included with this version, it fixes previously reported bugs.

2.0.1 (7/02/01)

- Fixed a minor BabelFish bug
- The Asian BabelFish filters(Korean, Chinese, Japanese) have been removed temporarily, interface changes need to be made before they'll work properly.
- Fixed a minor Translate bug
- Updating data works again(my old website was deleted by Hypermart)
- All references to my old website have been replaced.

2.0 (6/19/01)

- Removed the Search feature because of copyright concerns, I might replace it with a plug-in system in the future.
- Removed and/or rewrote a lot of outdated code.
- MacDICT now supports UTF-8, as required by the DICT RFC
- MacDICT now supports authentication.
- BabelFish works again.
- Added an alternate view for definitions("Don't Organize Results")
- Added a Welcome window that briefly describes all of MacDICT's features.
- Expanded font customization options.
- Various interface changes.

1.4.2

- Added a "Leave Query Windows Open" option
- Almost everything is threaded now
- Updating data works again, I created a bug in the last version
- The menus have been reorganized
- The CSM should work on all systems now, the new CSM was written by Ammon Skidmore - <http://www.skidperfect.com>

1.4.1

- The CSM isn't automatically installed anymore, it may work, it may not, just try it and find out.
- MacDICT's Data file is stored in the Preferences folder now
- Added a "Grab Clipboard Text" option, when this is on, all query windows will grab the clipboard's text when they're opened.

1.4

- Bug Fixes
- Lots of UI tweaks
- MacDICT now checks if the OS is compatible before installing the CSM

1.3.9

- BabelFish works again
 - BabelFish data can now be updated without releasing a new version
 - Added a Control Strip Module(Requires OS 8.5 or higher)
- The CSM will be installed the first time you launch this version of MacDICT

1.3.8

- Bug Fixes

1.3.7

- MacDICT now uses the new BabelFish site, allowing for 3 new translations :
 - French To German
 - German To French
 - Russian To English
- Added a "Browser Required" section for copyrighted web sites
- Added a couple new sites

1.3.6

- Fixed 2 bugs that caused an "updated" window come up the first time you opened a new version of MacDICT when the app was actually the newest version.
- Fixed the version number in the app, and the documentation(it said 1.3.4 in a number of places)

1.3.5

- MacDICT is now scriptable(also supports listening)
- All data can now be saved to disk
- Added BabelFish(Full text translation - babelfish.altavista.com)
- Added a Default Window option
- Fixed a bug with the default translation(searching for words with special characters in them didn't work, example: qué)
- Fixed other minor annoying bugs

1.3.4

- Added Printing
- Added a "Remember Selections" option, it saves the last selected item in all popup menus
- Added Version Checking
- Added a "Check for Updates on Launch" option, when it's on, MacDICT will automatically check for new versions of itself, and the Sites file everytime you open it

1.3.3

- The Sites file can now be updated

1.3.2

- Added Find/Find Again
- Added Export
- All sites now come with descriptions
- The Up/Down button(Definitions window) now disables either side when you can't go any

farther

- Added 2 new sites: Glossary of Microbiology, and Webopedia
- Added support for multiple types of content in the same page(try Webopedia)
- Added a Custom Font option
- The Article window now supplies more information about the file your viewing

1.3.1

- More bug fixes
 - Removed an unnecessary speed decrease I created in 1.3
 - HTML is now parsed in the background
 - The about box does a nifty zoom box thing now
 - bains@table.jps.net died, use bains@mac.com
- MacDICT uses HTMLField(by Doug Holton) to parse HTML, forgot to give him credit

1.3

- Minor bug fixes
- Added Web Search(Let's you access databases available on the web)
- You can now use a custom dict server(defaults to www.dict.org in case dict.org goes down)

1.2

- Matches are now parsed in the background
- Fixed a bug that sometimes caused a StackOverflowException
- The Alert dialogs are much cleaner now and don't leave the menus disabled after you close them
- Added Translations
- Window positions for all "query" windows are now saved(window positions are not saved for the other windows because you can have as many of them open as you want)
- Option-resizing a window now sets the default size for that window(the size the window will open at)

1.1

- dict.org doesn't seem to be responding, but www.dict.org is working fine
- MacDICT now connects to www.dict.org

1.0

- Initial Release
