

Makunouchi Bento

Makunouchi Bento is:

- A Romanian duo specialized in experimental music.
- A vst plugin custom-developed by Big Tick for the above artists, and finally released as free software.

The plugin ring-modulates incoming audio with sine waves of continuously varying frequency, and runs the result through a state-variable filter. It can often produce unexpected effects, from stuttering rhythms to ambient tones.

Range	Select the range of the speed knob. With low values, the modulator wave acts like a gapper. With higher values, the modulator gets into the audio range and generates strange overtones.
Speed	Select the base speed of the modulator.
Mod	Select the amount of speed modulation.
Feedback	Amount of cross-feedback between the left and right modulators
Cutoff	The filter cutoff frequency
Rez	The filter resonance
Low, Mid, High	The amount of lowpass, bandpass, and highpass output from the filter.
Sin 1 to 5	Select the shape of the modulator, from sine to sine ⁵ .
