

SPEED UP MICROSOFT ACCESS BY 5-25%!

If you are using Microsoft Access with less than 8mb of Ram then you will probably find it runs very slowly. This is because the system uses your Hard Disk when it runs out of RAM which can be up to 1,000 times SLOWER. Ram conservation is therefore of paramount importance.

By taking the following steps you can make your Access applications run between 5% and 25% faster depending on your configuration.

1. TAKE A COPY of UTILITY.MDA and MSACCESS.INI and keep them safe.
2. Duplicate both files, remembering to rename them.
3. Edit the duplicate INI file and remove any reference to Wizards
4. Delete all Forms from the duplicate UTILITY.MDA. (If your application does not require Financial Functions then you can delete this module).
5. Create 2 batch files that will swap between the original and duplicate files.

Try running your application with the original files and then with the new ones. It should be noticeably faster with the new ones.

IF YOU HAVE ANY PROBLEMS WITH THE ABOVE, WE CAN SUPPLY EVERYTHING ON DISK WITH EASY STEP BY STEP INSTRUCTIONS FOR ONLY 20 POUNDS / 30 DOLLARS. SEND TO :- SELECTIVE SOFTWARE, 169 DALKEITH ROAD, EDINBURGH, EH16 5BY.
