

Package Tracking Interaction Suite

Version 1.0 Drumbeat 2000

Release Notes:

This suite contains four package-tracking interactions for shipments delivered by FedEx, UPS, DHL or United States Postal Service (USPS). To use any of the individual interactions you must import the corresponding .CTR file into the Contract Builder. You can access the Contract Builder from the Drumbeat Tools menu. The interactions generate the necessary URL to check the status of the package shipped out via the designated courier.

The FedEx interaction can be applied between any source with an onClick event and three (3) edit boxes. These edit boxes provide the Tracking Number, Destination Country and the Shipping Date for the FedEx package to be tracked. Note: Four participants must be selected for this interaction to work correctly.

The UPS interaction can be applied between any source with an onClick event and one edit box. The edit box provides the Tracking Number or the Reference number of the UPS package to be tracked.

The DHL interaction can be applied between any source with an onClick event and one edit box. The edit box provides the 10-digit Tracking Number for the DHL package to be tracked.

The USPS interaction can be applied between any source with an onClick event and one edit box. The edit box provides the Tracking number of the USPS package to be tracked.

These interactions are designed to work with a recordset SmartElement. If you track FedEx, UPS and USPS shipments in separate databases then you can expose that database to your Intranet via Drumbeat Data Form Wizard. Expose the required elements as edit boxes or hidden text elements and apply the interaction to provide your Intranet with a single click 'Tracking' status button.
