

## Pageset Static Contracts

*These contracts are used by the Pageset wizard and should not be modified*

These contracts mimic the functionality of database navigation and databinding navigation contracts, in that they give the impression of navigating through a series of records. However, the underlying implementation is quite different. As opposed to the server-side and databound Pagesets, in which subsequent pages are generated on the fly, static Pagesets are really individual pages for each record. Because the Pageset wizard implements these pages for you, and because the tedium of generating individual static pages for each record in anything other than a small set of data is a strong deterrent to manual configuration, it is unlikely that you will ever explicitly use these contracts. If you are interested in implementing a static Pageset solution, it is advisable to let the wizard do the dirty work (which will automatically set up the contracts) and concern yourself with modifying the layouts generated by the wizard if desired.

For more information on configuring and using the different flavors of Pagesets, consult Chapter 14 of the User's Guide.
