DragDrop Contracts

Version V10_30 Drumbeat 2000

This document describes how to use the DragDrop interactions. The DragDrop suite includes two interactions

- simple drag-drop activation (Any 4.0 and above version)
- drag-drop to a specific target region (IE 4.0 and above version)

1. Drag the image [source] around the browser window

This is a "Any 4.0 and above" version of the drag interaction. With this activation assigned the image can be moved around the browser window.

2. Set [target] the drop zone for [source]

This is a "IE 4.0 and above" version of the drag interaction. This interaction is applied between an image and the DropZone SmartElement. The DropZone creates the target drop region for the draggable image. The image can be dragged around the browser window, and can be moved only within the assigned drop region. When released outside of the DropZone region, the image snaps back to the coordinates from where the drag action was initiated.
