ASP Miscellaneous Contracts

This is a collection of miscellaneous contracts that require an ASP server to execute.

The contract "Include virtual file" inserts an ASP include statement in your generated ASP code.

The contract "Replace token with contents of form element" is an inter-page communication contract. This contact transfers the contents of a text element (edit box, or hidden text) to the token in the current page. You have to tell the contract which form elements value to use from the previous page.

The contract "Detect Browser and Redirect" is an alternative to Drumbeat SmartPages. You have to manually enter each page that the four browser categories should re-direct to.

There are other miscellaneous contracts that you may find useful in this category.

As always, visit www.drumbeat.com for the latest Drumbeat contracts and SmartElements.
