

About FileNameLengthChecker

HTML-Optimizer does not like file names that have more than 31 characters. Moreover, it's not good practice to use such long file names on the Internet.

You can easily check for file names that are too long by **dropping your web folder on the FileNameLengthChecker icon**. If there are any file names that need to be shortened, you will find them in a text file named "List of Long File Names.txt". If you change file names, take care that you adapt the links that point at the files concerned as well, to avoid broken links.

Please check your web folder before you open HTML-Optimizer!
