

UnicodeChecker

This release should conform to The Unicode Standard, Version 4.0

What is it?

UnicodeChecker is a utility to browse the Unicode character set. For any character you select, UnicodeChecker can tell you the decimal Unicode, the hexadecimal Unicode, the hexadecimal UTF-8, UTF-16 and UTF-32 code, the Unicode name and lots more. Note that there is ToolTip help available at many places.

You can also go the other way round: By typing or pasting a character in the “Glyph” field and hitting the return key or dropping a string on the main window,

UnicodeChecker will present the according character information.

You can find characters by their corresponding Unicode name using the “Find Character” command from the “Edit” menu.

Last but not least, UnicodeChecker features several Utilities for converting text to and from various formats (e.g. HTML character entities). The Utilities are available from the “File” menu and are available to other applications from the “Services” menu.

More Information

More information on the features of UnicodeChecker is available from UnicodeChecker’s Help menu.

Disclaimer

Although care was taken to ensure conformance of this release of UnicodeChecker with The Unicode Standard current at the time of release, earthlingsoft cannot guarantee that UnicodeChecker does not contain any bugs that may prevent full conformance with The Unicode Standard.
