For informations and new releases of CocoaMySQL visit http://cocoamysql.sourceforge.net
Please mail bugs and requests to lorenz@textor.ch

CocoaMySQL uses the SMySQL framework by serge cohen to connect to the MySQL database.
See mysql-cocoa.sourceforge.net for more informations.
Thanks to serge cohen for developing this framework!

Warning: Edited rows aren't written to the database until you deselect it (to improve speed and to avoid problems with multiple keys).

Version History
v0.3
- save passwords of favorites in keychain
- save favorites directly from the connect-window
- fixed bug when filtering tables by date-fields
- fixed bug when connection get lost while dumping a database
v0.2
- added application icon (i'll design a better icon as soon as I have a bit time...)
- selecting a table now loads only structure OR content (depending on the selected tab) (faster if you are working only on the structure of big tables!)
- added possibility to edit fields with multiple lines (for example large blob-fields)
- fixed some bugs when using jaguar (OS 10.2)
v0.1b
First release of CocoaMySQL including basic features like:
- create and drop databases
- create, change and drop tables
- add, change and drop fields and indexes
- view table content
- add and remove rows
- perform custom queries
- dump tables
