What's New in RoboHELP® Office 9

Full integration with any leading HTML editor

Now you can make a powerful Help development tool out of your favorite HTML editor, like Dreamweaver, HomeSite, FrontPage and more. RoboHELP 9.0 dynamically detects which HTML editors are installed on your system and automatically integrates them as editing environments. Now you can choose to create and edit topics with your favorite HTML editor. It's as easy as right clicking on a topic. You can also easily select a default editor for your entire project.

Greatly improved, built-in HTML editor

It produces cleaner HTML code and has a friendly user interface modeled after Word 2000 and FrontPage 2000 (including things like drag-and-drop text and images, unlimited undo/redo capabilities, and improved dialogs). The layout capabilities are much more powerful, and its style handling is significantly improved. There are also many improvements to the DHTML handling and other user - friendly features (look for the familiar "ruler" at the top of the editor and a new feature called a "tag list" that provides visual hierarchy).

Faster loading WebHelp and easier project modification uploading

The new WebHelp 4 compression technology gives you the ability to compress your navigation elements and project files, which makes distribution and download time up to 10 times faster for your end users a significant improvement. You'll also like WebHelp's new Smart Publishing Wizard. It lets you quickly upload only the modifications you make to your project instead of having to upload the entire project.

Full support for Oracle Help for Java

Now you can add another Help format to your repertoire. RoboHELP Office 9.0 gives you full support for Oracle Help for Java, a new Help format developed by Oracle for deployment with any Java application. Not Oracle-dependent, it's an ideal 100% pure Java solution that anybody can use. With version 9.0, you'll be able to generate Oracle Help for Java just as easily as you generate WebHelp, Microsoft HTML Help, WinHelp, and JavaHelp. It's an exclusive too - RoboHELP 9.0 is the only Help development tool that provides support for Oracle Help for Java.
