

# Technote 1160

## What's New With ColorSync 2.6

By Scott Kuechle  
Apple Worldwide Developer Technical Support

---

### CONTENTS

[System Requirements](#)[Checking for ColorSync 2.6](#)[ColorSync 2.6 Version Information](#)[New ColorSync 2.6 APIs](#)[New ColorSync 2.6 for Windows APIs](#)[ColorSync 2.6 for Macintosh  
Compatibility Issues](#)[ColorSync 2.6 for Windows  
Compatibility Issues](#)[Further References](#)[Downloadables](#)

ColorSync 2.6 is the latest version of Apple Computer's color management architecture for Mac OS, Windows 95/98, and Windows NT 4.0. This Technote describes in detail the changes in this new version of ColorSync. This note is primarily intended for developers who are using the ColorSync APIs.

---

## System Requirements

ColorSync 2.6 for Macintosh requires a PowerPC machine running Mac OS 8.1 or later. ColorSync 2.6 for Windows requires an IBM-compatible PC running Windows 95/98 or Windows NT 4.0.

[Back to top](#)

## Checking for ColorSync 2.6

### Macintosh

To determine if the ColorSync Manager shared libraries have been loaded on a PowerPC machine, use the `Gestalt` function with the `gestaltColorMatchingAttr` selector. Test the bit field (bit 1) indicated by the `gestaltColorMatchingLibLoaded` constant in the response parameter. If the bit is set, the ColorSync Manager shared libraries are loaded. The following code snippet shows how this is done. This code snippet initializes the `ColorSyncAvailable` Boolean variable to `false`.

```

Boolean CheckIfColorSyncAvailableOnPPC (void)
{
    Boolean ColorSyncAvailable = false;
    long gestaltResponse;

    if (Gestalt(gestaltColorMatchingAttr, &gestaltResponse) == noErr)
    {
        ColorSyncAvailable =
            gestaltResponse & (1 << gestaltColorMatchingLibLoaded);
    }

    return ColorSyncAvailable;
}

```

## Windows 95/98, Windows NT 4.0

To check for the presence of ColorSync under Windows 95/98 and Windows NT, use the new ColorSync 2.6 function `CMGetColorSyncVersion` (see the section "[New ColorSync 2.6 APIs](#)" below for the details). ColorSync will first attempt to load the ColorSync DLLs if you call this function on a Windows system. If the ColorSync DLLs can't be loaded, an error code will be returned, indicating ColorSync is not present.

The `CMGetColorSyncVersion` function also returns the ColorSync version information. Here's a code snippet that checks for ColorSync version 2.6 on Windows:

```

#define kColorSync26 0x00000260

CMError err;
UInt32 version;

err = CMGetColorSyncVersion(&version);
if (err == noErr)
{
    if (version >= kColorSync26)
    {
        /* ColorSync 2.6 or better is installed */
    }
}
else
{
    /* ColorSync not present */
}

```

[Back to top](#)

## Getting ColorSync 2.6 Version Information

### Windows

As described in the section "[Checking for ColorSync 2.6](#)", use the new ColorSync 2.6 function `CMGetColorSyncVersion` to get ColorSync version information on machines running Windows 95/98 & Windows NT 4.0.

### Macintosh

As described in the section "[Checking for ColorSync 2.6 - Windows](#)", use the new ColorSync 2.6 function `CMGetColorSyncVersion` to get ColorSync version information on the Macintosh.

#### Important Note:

On Macintosh systems with ColorSync 2.6 installed, the `CMGetColorSyncVersion` function returns the value `0x00026000` in the version field. However, on a Windows system with ColorSync 2.6 installed, the same `CMGetColorSyncVersion` function returns the value `0x00000260`, which is consistent with `Gestalt` return values. Future versions of ColorSync 2.6 on the Macintosh will correct this problem and return values which are consistent with `Gestalt`.

Alternately, you can use the `Gestalt` function with the `gestaltColorMatchingVersion` selector to get ColorSync version information on the Macintosh.

You can modify and use the following sample code to test for version 2.6 of the ColorSync Manager. This function initializes the Boolean variable `ColorSyncAvailable` to `false` and sets it to `true` if version 2.6 or later of the ColorSync Manager is installed.

```
#define kColorSync26 0x00000260

Boolean CheckForColorSyncMacVersion26(void)
{
    Boolean ColorSyncAvailable = false;
    long version;

    if (Gestalt(gestaltColorMatchingVersion, &version) == noErr)
    {
        if (version >= kColorSync26)
        {
            ColorSyncAvailable = true;
        }
    }

    return ColorSyncAvailable;
}
```

[Back to top](#)

## New ColorSync 2.6 APIs

The following new APIs were added to ColorSync 2.6:

```
CMError CMGetProfileDescriptions (CMProfileRef prof,
```

```

char          *aName,
UInt32        *aCount,
Str255        mName,
ScriptCode    *mCode,
UniChar       *uName,
UniCharCount  *uCount);

```

## Field Descriptions

prof	A reference to the profile from which to obtain the desc tag info.
aName	A pointer to a field which is to receive the profile name as a 7-bit Roman ASCII string.
aCount	A pointer to a field which is to receive a count of the number of characters returned in the aName field above.
mName	A pointer to a field which is to receive the localized profile name string in Mac script-code format.
mCode	A pointer to a field which is to receive the script code corresponding to the name string returned in the mName parameter above.
uName	A pointer to a field which is to receive the Unicode localized profile name string.
uCount	A pointer to a field which is to receive a count of the number of Unicode (2-byte) characters returned in the uName field above.

```

CMError CMSetProfileDescriptions (CMProfileRef    prof,
                                const char        *aName,
                                UInt32            aCount,
                                ConstStr255Param  mName,
                                ScriptCode        mCode,
                                const UniChar     *uName,
                                UniCharCount      uCount);

```

## Field Descriptions

prof	A reference to the profile into which to set the desc tag info.
aName	A pointer to a field containing a 7-bit Roman ASCII profile name string which is to be set for the profile. This string must be null-terminated.
aCount	A count of the number of characters in the aName field above.
mName	A pointer to a field containing the localized profile name string in Mac script-code format which is to be set for the profile. This string must be null-terminated.
mCode	The script code corresponding to the name string in the mName parameter above.
uName	A pointer to a field containing the Unicode localized profile name string which is to be set for the profile. This string must be null-terminated.
uCount	A count of the number of Unicode characters in the uName field above (do not confuse this with a byte count, because each Unicode character requires two bytes).

## DESCRIPTION

Use these functions to get/set the description tag data for a given profile. The ICC Profile Format Specification (available at <<http://www.color.org>>) includes a Description tag ('desc'), designed to provide more information about a profile than can be contained in a file name. This is especially critical on file systems with 8.3 names. The tag data can consist of up to three separate pieces (strings) of information for a profile. These different strings are designed to allow for display in different languages or on different computer systems. Applications typically use the strings to show profiles in a list or a pop-up menu. ColorSync 2.6 includes these new APIs for accessing

information, and also checks for the validity of the 'desc' tag according to the ICC Spec.

```
CLError NCWConcatColorWorld (CMWorldRef *cw,  
                                NCWConcatProfileSet *profileSet,  
                                CMConcatCallbackProc proc,  
                                void *refCon);
```

## Field Descriptions

cw	A reference to a color world that the ColorSync Manager returns if the function completes successfully. You pass this reference to other functions that use the color world for color-matching and color-checking sessions.
profileSet	An array of profiles describing the processing to be carried out. The array is in processing order source through destination.
proc	A calling-program-supplied callback function that allows your application to monitor progress or abort the operation.
refCon	A reference constant containing data specified by the calling application program.

## New structures for use with this function:

```

struct NCMConcatProfileSet {
    OSType          cmm;                /* e.g., 'KCMS'. Uniquely IDs the CMM, or 0000 */
    unsigned long   flags;              /* specify quality */
    unsigned long   flagsMask;          /* which bits of flags to use to override profile. */
    /*
    unsigned long   profileCount;        /* how many ProfileSpecs in the following set */
    NCWConcatProfileSpec  profileSpecs[]; /* A new structure, defined below */
};

struct NCWConcatProfileSpec {
    unsigned long   renderingIntent;    /* intent to use along with transformTag. */
    unsigned long   transformTag;       /* one of a set of tag identifiers, defined below */
    /*
    CMPProfileRef   profile;            /* the profile to extract the transform from */
};

enum {
    kNoTransform      = 0,              /* Not used */
    kUseAtoB          = 1,              /* Use 'A2B*' tag from this profile or equivalent */
    kUseBtoA          = 2,              /* Use 'B2A*' tag from this profile or equivalent */
    kUseBtoB          = 3,              /* Use 'pre*' tag from this profile or equivalent */

    /* For typical device profiles the following synonyms may be useful */

    kDeviceToPCS      = kUseAtoB,       /* Device Dependent to Device Independent */
    kPCSToDevice      = kUseBtoA,       /* Device Independent to Device Dependent */
    kPCSToPCS         = kUseBtoB,       /* Independent, through device's gamut */

    /* This is provided for default behavior when specifying rendering intent in the NCMConcat
    */

    kUseProfileIntent = (long) 0xFFFFFFFF /* For renderingIntent in NCMConcatProfileSpec */
};

/*
    Caller-supplied progress function for NCMConcatInit & NCMNewLinkProfile routines
*/

typedef STACK_UPP_TYPE(CMConcatCallbackProcPtr) CMConcatCallbackUPP;
typedef CALLBACK_API( Boolean, CMConcatCallbackProcPtr )
    (long progress, void *refCon);

/*
    Callback Proc Creation example:
*/

CMConcatCallbackUPP myCallbackProc = NewCMConcatCallbackProc(myCallbackProc);

```

## DESCRIPTION

The `NCWConcatColorWorld` function defines a color world for color transformations among a series of concatenated profiles. The caller can override the CMM that would normally be selected by ColorSync by providing a CMM identifier in the `NCMConcatProfileSet` structure, or pass 0 to accept ColorSync's CMM selection (note that this could either be the user's preferred CMM selection or the CMM called for in the profile). The `flags` and `flagsMask` parameters are provided to allow easy customization of such attributes as quality and gamut-checking, while preserving the other settings. Each profile in the set can be customized by overriding the intent, and the selection of the transform tag. Together with other profiles, a custom-rendering environment can be set up to transform to or from device-dependent spaces with a minimum of gamut compression and/or unnecessary transformations to and from connection spaces. This flexibility comes at the price of specific knowledge of the profile contents and how device gamuts overlap.

Note that for standard input and output device profiles, `A2B` and `B2A` tags represent transforms from data space to connection space and from connection space to data space, respectively. Under these circumstances, the caller would not normally be able to use the same transform tags (e.g., `kUseAtOB`) consecutively, since a connection space would not be the same as the subsequent data space. If the spaces aren't the same, the caller will get a `cmCantConcatenateError` error (-178) returned. For profiles of type `cmLinkClass`, `cmAbstractClass`, `cmColorSpaceClass`, and `cmNamedColorClass`, these constants are not always meaningful, and the caller is encouraged to think in terms of the actual tags present in the profiles (e.g., `A2B0` or `B2A0`). Under these conditions, it may well be appropriate to specify two transform tags of the same type consecutively, as long as the actual color spaces align in between tags. If this is not the case, a `cmCantConcatenateError` error (-178) is returned.

The `CallbackProc` is provided as protection against the appearance of a stalled machine during lengthy color world processing. If a CMM takes more than several seconds to process the information and create a color world, it will call the `CallbackProc`, if one is provided, and pass it the `refCon` provided. This is also true for `NCWNewLinkProfile`, described below:

```
CMError NCWNewLinkProfile (CMProfileRef      *prof,
                          const CMProfileLocation *targetLocation,
                          NCMConcatProfileSet *profileSet,
                          CMConcatCallbackProc  proc,
                          void                  *refCon);
```

## Field Descriptions

prof	The returned profile reference.
targetLocation	The location of the profile, which you specify using the <code>CMProfileLocation</code> data type. Commonly a profile is disk-file based. However, the profile may be a file-based profile, a handle-based profile, or a pointer-based profile.
profileSet	The profile set structure.
proc	A calling-program-supplied callback function that allows your application to monitor progress or abort the operation.
refCon	A reference constant containing data specified by the calling application program.

## DESCRIPTION

The same new flexibility in creating color worlds is extended to link profiles, which are now not assumed to go from device color space to output device color space. The returned profile is open, and should be closed when you are with it.

CMError	<code>NCMSetSystemProfile (const CMProfileLocation *profLoc);</code>
---------	--

## Field Descriptions

profLoc	The location of the profile, which you specify using the <code>CMProfileLocation</code> data type. Commonly a profile is disk-file based. However, the profile may be a file-based profile, a handle-based profile, or a pointer-based profile.
---------	---

## DESCRIPTION

Prior to ColorSync 2.6, the API for setting the System Profile supported only the `FSSpec` file specification type specifying a profile. This new API is designed to address Windows file systems specifications as well.

```
CMError NCMUnflattenProfile (CMProfileLocation *targetLocation,
                           CMFlattenUPP      proc,
                           void              *refCon,
                           Boolean            *preferredCMMnotfound);
```

## Field Descriptions

targetLocation	The location of the profile you wish to unflatten, which you specify using the <code>CMProfileLocation</code> data type. Commonly a profile is disk-file based. However, the profile may be a file-based profile, a handle-based profile, or a pointer-based profile.
proc	A user-defined procedure which is called during the unflatten operation.
refCon	A reference constant containing data specified by the calling application program.
preferredCMMnotfound	A return value indicating whether or not the CMM specified in the profile was found.

## DESCRIPTION

Use this function to unflatten a profile.

```
CMError CMIterateCMMInfo (CMIterateUPP      proc,
                          UInt32             *count,
                          void              *refCon);
```

## Field Descriptions

proc	A calling-program-supplied callback function that allows your application to monitor progress or abort operation.
count	A count of the number of CMMs referenced is returned here.
refCon	A reference constant containing data specified by the calling application program.

## NEW STRUCTURES FOR USE WITH THIS FUNCTION

```
OSErr CMIterateUPP(
    CMMInfo* iterateData,          /* Ptr to a structure containing
                                   /* information about a particular CMM */
```

```

void*      refcon      /* Caller-defined data, passed through from CMIterate
API */
);

struct CMInfo {
    unsigned long    dataSize;      /* Size of this structure - for compatibility */
    OSType           CMMType;      /* Signature of CMM */
    OSType           CMMfr;        /* Vendor, e.g. 'appl' */
    unsigned long    CMMVersion;    /* Version number */
    Handle           CMMcons;      /* If available, can be a group with varying size
& depth */
    unsigned char    ASCIIName[32]; /* Pascal string - name */
    unsigned char    ASCIIDesc[256]; /* Pascal string - description or copyright */
    UniCharCount     UniCodeNameCount; /* Count of UniChars in following array */
    UniChar           UniCodeName[32]; /* The name in UniCode chars */
    UniCharCount     UniCodeDescCount; /* Count of UniChars in following array */
    UniChar           UniCodeDesc[256]; /* The description in UniCode chars */
};

```

## DESCRIPTION

The `CMIterateCMInfo` function returns information for all CMMs installed on the system. The caller can pass `CMIterateUPP` param to simply get a count of CMMs. If a `CMIterateUPP` proc is provided, it will be called for each CMM installed - with the `CMInfo` structure filled accordingly. The caller can pass a data reference to `CMIterateUPP`, which will then be passed to the `CMIterateUPP`. This might be used to allow some of the information in the `CMInfo` structure to be put into a menu, for example, by passing a menu reference as the `refcon`. Either the proc or the count must be provided. The caller will get a `paramErr` if both are nil.

CMError	CMGetColorSyncVersion (UInt32 *version);
---------	--

## Field Descriptions

version	The version of ColorSync installed on the machine is returned here
---------	--

## DESCRIPTION

Returns ColorSync version information. `CMGetColorSyncVersion` relieves the Mac OS developer from having to call `Gestalt` to find out the version of ColorSync installed on the system. Since no such API exists on other platforms, ColorSync 2.6 introduced a cross-platform way of obtaining this version information.

### Important Note:

The return value for ColorSync 2.6 is 0x00026000 on the Macintosh. This is not consistent with what is currently returned by `Gestalt` (0x00000260). Future versions of ColorSync on the Macintosh will be fixed so they are consistent with `Gestalt` return values.

## Deprecated APIs

Support for the following APIs will be eliminated or limited in the future:

API	ColorSync version	Win	on Mac	Deprecation
(CM)BeginMatching	1.x	No	No	Pict-based, uses Profiles
NCMBeginMatching	2.x	No	Yes	Pict-based, uses Profiles
(CM)EndMatching	1.x	No	Yes	Pict-based
(CM)EnableMatching(Comment)	1.x	No	Yes	Pict-based
(CM)UseProfile(Comment)	1.x	No	No	Pict-based, uses Profiles
NCMUseProfileComment	2.x	No	Yes	Pict-based, uses Profiles
(CM)DrawMatchedPicture	1.x	No	No	Pict-based, uses Profiles
NCMDrawMatchedPicture	2.x	No	Yes	Pict-based, uses Profiles
(CM)GetProfileName	1.x	No	No	Uses 1.x Profi
(CM)GetProfileAdditionalDataOffset	1.x	No	No	Uses 1.x Profi
(CM)GetProfile	1.x	No	No	Profile Respon function
(CM)SetProfile	1.x	No	No	Profile Respon function
(CM)SetProfileDescription	1.x	No	No	Profile Respon function
(CM)GetIndexedProfile	1.x	No	No	Profile Respon function
(CM>DeleteDeviceProfile	1.x	No	No	Profile Respon function
ConcatenateProfiles	1.x	No	No	Uses 1.x Profi
CWNewColorWorld	1.x	No	No	Uses 1.x Profi
(CM)GetColorSyncFolderSpec	1.x, 2.x	No	Yes	Mac-specific directory info
CMSearchGetIndProfileFileSpec	2.x	No	Yes	Mac-specific fi data type: FSSJ
CMSetSystemProfile	2.x	No	Yes	Mac-specific fi data type: FSSJ
CMUnflattenProfile	2.x	No	Yes	Mac-specific fi data type: FSSJ
CMGetProfileByAVID	2.5	No	Yes	Mac-specific Display Manag AVID
CMSetProfileByAVI	2.5	No	Yes	Mac-specific Display Manag AVID
CWMatchPixMap	1.x, 2.x	QT?	Yes	Mac-specific da PixMap

- Supported on

		Win if QTML installed		
CWCheckPixMap	1.x, 2.x	QT?	Yes	Mac-specific data PixMap
		- Supported on Win if QTML installed		
CMAccelerationLoadTables	2.x	No	No	CMM Function acceleration not platform independent
CMAccelerationCalculateData	2.x	No	No	CMM Function acceleration not platform independent

## New ColorSync 2.6 for Windows APIs

```
CMError CWMat chHBITMAP (CMWorldRef
                        HBITMAP
                        CMBitmapCallbackUPP
                        void
                        cw,
                        hBitmap,
                        progressProc,
                        *refCon);
```

### Field Descriptions

cw	A reference to the color world in which the matching is to occur.
hBitmap	Handle of a bitmap to be matched. This is a standard Windows Win32 HBITMAP structure.
progressProc	A calling-program-supplied callback function that allows your application to monitor progress or abort the operation as the bitmap colors are matched.
refCon	A reference constant containing data specified by the calling application program.

### DESCRIPTION

CWMat chHBITMAP provides the same kind of matching to platform-specific data as CWMat chPixMap on Mac OS.

```
CMError CMGetCol orSyncFol derPath (Boolean
                                char
                                UInt32
                                createFolder,
                                *lpBuffer,
                                uSize);
```

### Field Descriptions

createFolder	A Boolean specifying whether to create a new ColorSync profiles directory if one cannot be found.
lpBuffer	Contains a pointer to a buffer where you would like the ColorSync folder path returned.

uSize	Contains the size of the buffer.
-------	----------------------------------

## DESCRIPTION

ColorSync 2.6 now places a "ColorSync Profiles" folder directly in the System Folder for all installed profiles. In CMGetColorSyncFolderSpec function on Mac OS, CMGetColorSyncFolderPath gives Windows developers the location of this folder. If the "ColorSync Profiles" directory does not exist, the createFolder parameter determines whether or not it is created.

## New CMM APIs

The following APIs specify new CMM entry points which ColorSync will call to handle the creation of new color link profiles as returned by the NCWConcatColorWorld and NCWNewLinkProfile functions respectively. These interest to CMM developers only.

```
CMError NCMMConcatInit (CMStorageHdl      hStorage,
                        NCMMConcatProfileSet *profileSet,
                        CMConcatCallbackUPP proc,
                        void                *refCon);
```

## Field Descriptions

hStorage	The CMM's private instance storage.
profileSet	Set of profiles to concatenate into a color world.
proc	Callback procedure.
refCon	User data passed on to callback procedure.

## DESCRIPTION

This is the API which ColorSync calls when an application calls the NCWConcatColorWorld function. The new this function is kNCMMConcatInit. The CMM is responsible for validating the profiles specified in the profile set building a transform using these profiles. If the CMM cannot build such a transform, it should return a cmCantConcatenateErr error, or another appropriate error code.

```
CMError NCMMNewLinkProfile (CMStorageHdl      hStorage,
                           CMProfileRef      prof,
                           NCMMConcatProfileSet *profileSet,
                           CMConcatCallbackUPP proc,
                           void                *refCon);
```

## Field Descriptions

hStorage	The CMM's private instance storage.
prof	The CMM will add the appropriate tags to this profile.

profileSet	Set of profiles to concatenate into a link profile.
proc	Callback procedure.
refCon	User data passed on to callback procedure.

## DESCRIPTION

This is the API which ColorSync calls when an application calls the `NCWNewLinkProfile` function. The new sel function is `kNCMMNewLinkProfile`. The CMM is responsible for validating the profiles specified in the profile s building a link profile using these profiles. If the CMM cannot build a link profile, it should return a `cmCantConcatenateErr` error, or another appropriate error code. ColorSync will create the profile (via `CMNewP` before calling the CMM, so the CMM need only add the appropriate tags to the profile before returning. ColorSy ensure that the tags are written to the profile by calling `CMUpdateProfile`, before returning it to the caller.

## New ColorSync Scripting Library APIs

ColorSync 2.6 provides a new set of scripting library APIs which are designed to give applications access to the format utilities provided by the new ColorSync 2.6 AppleEvent terminology. In fact, the code in ColorSync whi to AppleEvents actually calls this same library. Listed below are the functions introduced in this new scripting lit

```
CMError CMValidateImage (const FSSpec *spec);
```

### Field Descriptions

spec	A file specification for the the image file you wish to validate.
------	---

## DESCRIPTION

This function validates the specified image file. ColorSync will check with any installed scripting plug-ins to see recognize the image's file format. If a scripting plug-in is found which recognizes the image's file format, `CMValidateImage` will return `noErr`. If the image's file format is not recognized, `CMValidateImage` will return `cmInvalidImageFile` error.

```
CMError CMGetImageSpace (const FSSpec *spec,
                        OSType *space);
```

### Field Descriptions

spec	A file specification for the image file.
space	The signature of the data color space of the color values of colors for the image file is returned here.

## DESCRIPTION

This function returns the signature of the data color space in which the color values of colors in an image are exp

```
CMError CMEmbedImage (const FSSpec *specFrom,
                     const FSSpec *specInto,
```

```
Boolean      repl,
CMProfileRef embProf);
```

## Field Descriptions

specFrom	A file specification for the image file.
specInto	If this parameter is a file, it specifies the resulting image. If this parameter is a folder, it specifies the location of the resulting image which will have the same name as the original file. If this parameter is not provided, the original file is modified.
repl	If a file with the same name already exists, it will be replaced if this parameter is set to true.
embProf	The profile to embed in the image.

## DESCRIPTION

This function will embed an image with an ICC profile.

```
CMError CMUnembedImage (const FSSpec *specFrom,
                        const FSSpec *specInto,
                        Boolean      repl);
```

## Field Descriptions

specFrom	A file specification for the image file.
specInto	If this parameter is a file, it specifies the resulting image. If this parameter is a folder, it specifies the location of the resulting image which will have the same name as the original file. If this parameter is not provided, the original file is modified.
repl	If a file with the same name already exists, it will be replaced if this parameter is set to true.

## DESCRIPTION

This function will remove any ICC profiles embedded in an image.

```
CMError CMMatchImage (const FSSpec *specFrom,
                      const FSSpec *specInto,
                      Boolean      repl,
                      UInt32      qual,
                      CMProfileRef srcProf,
                      UInt32      srcIntent,
                      CMProfileRef dstProf);
```

## Field Descriptions

specFrom	A file specification for the image file.
specInto	If this parameter is a file, it specifies the resulting image. If this parameter is a folder, it specifies the location of the resulting image which will have the same name as the original file. If this parameter is not provided, the original file is modified.
repl	If a file with the same name already exists, it will be replaced if this parameter is set to true.

qual	The optional quality for the match - normal, draft or best ( <code>cmNormalMode</code> , <code>cmDraftMode</code> or <code>cmBestMode</code> ).
srcProf	The optional source profile for the match.
srcIntent	The rendering intent for the match - perceptual intent, relative colorimetric intent, saturation intent, or absolute colorimetric intent ( <code>cmPerceptual</code> , <code>cmRelativeColorimetric</code> , <code>cmSaturation</code> or <code>cmAbsoluteColorimetric</code> ).
dstProf	The destination profile for the match.

## DESCRIPTION

Use this function to color match an image file.

```
CMError CMProofImage (const FSSpec *specFrom,
                      const FSSpec *specInto,
                      Boolean      repl,
                      UInt32       qual,
                      CMProfileRef srcProf,
                      UInt32       srcIntent,
                      CMProfileRef dstProf,
                      CMProfileRef prfProf);
```

## Field Descriptions

specFrom	A file specification for the image file.
specInto	If this parameter is a file, it specifies the resulting image. If this parameter is a folder, it specifies the location of the resulting image which will have the same name as the original file. If this parameter is not provided, the original file is modified.
repl	If a file with the same name already exists, it will be replaced if this parameter is set to true.
qual	The optional quality for the match - normal, draft or best ( <code>cmNormalMode</code> , <code>cmDraftMode</code> or <code>cmBestMode</code> ).
srcProf	The optional source profile for the match.
srcIntent	The rendering intent for the match between the source and destination profiles - perceptual intent, relative colorimetric intent, saturation intent, or absolute colorimetric intent ( <code>cmPerceptual</code> , <code>cmRelativeColorimetric</code> , <code>cmSaturation</code> or <code>cmAbsoluteColorimetric</code> ).
dstProf	The destination profile for the match.
prfProf	The proof profile for the match between the destination and proof profiles.

## DESCRIPTION

Use this function to proof an image file.

```
CMError CMLinkImage (const FSSpec *specFrom,
                     const FSSpec *specInto,
                     Boolean      repl,
                     UInt32       qual,
                     CMProfileRef lnkProf,
                     UInt32       lnkIntent);
```

## Field Descriptions

specFrom	A file specification for the image file.
specInto	If this parameter is a file, it specifies the resulting image. If this parameter is a folder, it specifies the location of the resulting image which will have the same name as the original file. If this parameter is not provided, the original file is modified.
repl	If a file with the same name already exists, it will be replaced if this parameter is set to true.
qual	The optional quality for the match - normal, draft or best ( <code>cmNormalMode</code> , <code>cmDraftMode</code> or <code>cmBestMode</code> ).
lnkProf	The device link profile for the match.
lnkIntent	The rendering intent for the match - perceptual intent, relative colorimetric intent, saturation intent or absolute colorimetric intent ( <code>cmPerceptual</code> , <code>cmRelativeColorimetric</code> , <code>cmSaturation</code> or <code>cmAbsoluteColorimetric</code> ).

## DESCRIPTION

Use this function to match an image file with a device link profile.

```
CMError CMCountImageProfiles (const FSSpec *spec,
                             UInt32      *count);
```

## Field Descriptions

spec	A file specification for the image file.
count	A count of the embedded profiles for the image is returned here.

## DESCRIPTION

Use this function to obtain a count of the number of embedded profiles for a given image.

```
CMError CMGetIndImageProfile (const FSSpec *spec,
                             UInt32      index,
                             CMProfileRef *prof);
```

## Field Descriptions

spec	A file specification for the image file.
index	The numeric index of the profile to return.
prof	The profile is returned here.

## DESCRIPTION

Use this function to obtain a specific embedded profile for a given image.

```
CMError CMSetIndImageProfile (const FSSpec *specFrom,
                             const FSSpec *specInto,
                             Boolean      repl,
                             UInt32      index,
                             CMProfileRef prof);
```

## Field Descriptions

specFrom	A file specification for the image file.
specInto	If this parameter is a file, it specifies the resulting image. If this parameter is a folder, it specifies the location of the resulting image which will have the same name as the original file. If this parameter is not provided, the original file is modified.
repl	If a file with the same name already exists, it will be replaced if this parameter is set to true.
index	The numeric index of the profile to set.
prof	The profile to set at the index designated by the index parameter.

## DESCRIPTION

Use this function to set a specific embedded profile for a given image.

## New CMBitmap Types

Several new **CMBi tmap** spaces were added in ColorSync 2.6 (see below) to provide developers with a wide range of formats appropriate for multiple platforms. Both the Mac and Windows versions of ColorSync 2.6 support all the formats.

Several bitmap spaces now can have a new space attribute flag **cmLi t t l eEndi anPacki ng** set to indicate Little-Endian. Another new variant **cmReverseChannel Packi ng**, which can apply to just about all of the new and old spaces is the "channels" attribute.

## Bitmap spaces supported in ColorSync 2.5

- cmGray16Space = cmGraySpace,
- cmGrayA32Space = cmGrayASpace,
- cmRGB16Space = cmWord5ColorPacking + cmRGBSpace,
- cmRGB24Space = cm24\_8ColorPacking + cmRGBSpace,
- cmRGB32Space = cm32\_8ColorPacking + cmRGBSpace,
- cmRGB48Space = cm48\_16ColorPacking + cmRGBSpace,
- cmARGB32Space = cm32\_8ColorPacking + cmAlphaFirstPacking + cmRGBASpace,
- cmRGBA32Space = cm32\_8ColorPacking + cmAlphaLastPacking + cmRGBASpace,
- cmCMYK32Space = cm32\_8ColorPacking + cmCMYKSpace,
- cmCMYK64Space = cm64\_16ColorPacking + cmCMYKSpace,
- cmHSV32Space = cmLong10ColorPacking + cmHSVSpace,
- cmHLS32Space = cmLong10ColorPacking + cmHLSSpace,
- cmYXY32Space = cmLong10ColorPacking + cmYXYSpace,
- cmXYZ32Space = cmLong10ColorPacking + cmXYZSpace,
- cmLUV32Space = cmLong10ColorPacking + cmLUVSpace,
- cmLAB24Space = cm24\_8ColorPacking + cmLABSpace,
- cmLAB32Space = cmLong10ColorPacking + cmLABSpace,
- cmLAB48Space = cm48\_16ColorPacking + cmLABSpace,
- cmGamutResult1Space = cmOneBitDirectPacking + cmGamutResultSpace,
- cmNamedIndexed32Space = cm32\_32ColorPacking + cmNamedIndexedSpace,

- cmMCFive8Space = cm40\_8ColorPacking + cmMCFiveSpace,
- cmMCSix8Space = cm48\_8ColorPacking + cmMCSixSpace,
- cmMCSeven8Space = cm56\_8ColorPacking + cmMCSevenSpace,
- cmMCEight8Space = cm64\_8ColorPacking + cmMCEightSpace

## New Spaces added for 2.6

- cmGray8Space = cmGraySpace + cm8\_8ColorPacking, 8-bit gray
- cmGrayA16Space = cmGrayASpace + cm16\_8ColorPacking, 8-bit gray + 8-bit alpha
- cmGray16LSpace = cmGraySpace + cmLittleEndianPacking, 16-bit gray, little-endian
- cmGrayA32LSpace = cmGrayASpace + cmLittleEndianPacking, 16-bit gray + 16-bit alpha, little-endian
- cmRGB565Space = cmRGBSpace + cmWord565ColorPacking, Variant of 1.5.5.5
- cmRGB565LSpace = cmRGBSpace + cmWord565ColorPacking + cmLittleEndianPacking, Variant of little-endian
- cmRGB16LSpace = cmRGBSpace + cmWord5ColorPacking + cmLittleEndianPacking, 1.5.5.5, little-endian
- cmRGB48LSpace = cmRGBSpace + cm48\_16ColorPacking + cmLittleEndianPacking, 16-bits per channel, little-endian
- cmARGB64Space = cmRGBASpace + cm64\_16ColorPacking + cmAlphaFirstPacking, 16-bits per channel w/leading alpha channel
- cmARGB64LSpace = cmRGBASpace + cm64\_16ColorPacking + cmAlphaFirstPacking + cmLittleEndianPacking, 16-bits / chl RGB w/leading alpha, little-endian
- cmRGBA64Space = cmRGBASpace + cm64\_16ColorPacking + cmAlphaLastPacking, 16-bits / chl RGB w/trailing alpha channel
- cmRGBA64LSpace = cmRGBASpace + cm64\_16ColorPacking + cmAlphaLastPacking + cmLittleEndianPacking, 16-bits / chl RGB w/trailing alpha, little-endian
- cmCMYK64LSpace = cmCMYKSpace + cm64\_16ColorPacking + cmLittleEndianPacking, 16-bits per channel CMYK, little-endian
- cmXYZ24Space = cmXYZSpace + cm24\_8ColorPacking, 8-bit per channel XYZ
- cmXYZ48Space = cmXYZSpace + cm48\_16ColorPacking, 16-bits per channel XYZ
- cmXYZ48LSpace = cmXYZSpace + cm48\_16ColorPacking + cmLittleEndianPacking, 16-bits per channel XYZ, little-endian
- cmLAB48LSpace = cmLABSpace + cm48\_16ColorPacking + cmLittleEndianPacking, 16-bits per channel, little-endian
- cmNamedIndexed32LSpace = cm32\_32ColorPacking + cmNamedIndexedSpace + cmLittleEndianPacking, 16-bits per channel, little-endian

## ICC Profile Description ('desc') Tag Handling

One important change in the recent release of ColorSync (version 2.6) is how it handles the description ('desc') tag in ICC profiles.

The 'desc' tag of a profile, as defined by the ICC, contains up to three strings. The first is a required 7-bit Roman string. The second is an optional localized Unicode string. The third, also optional, is a localized string in Mac script format. Applications typically use one of the available strings to show the name of profiles in a list or pop-up menu. A few other important devilish details in the ICC definition of the 'desc' tag. One is that all three strings must be terminated. Another is that all three strings are preceded by a character count that includes the null terminator. It is also noting that for the Unicode string, the character count must not be confused with a byte count because each Unicode character requires two bytes.

Previous releases of ColorSync only make partial use of this tag and, as a result, only performed limited error checking on its contents. For example, The ColorSync function `CMGetScriptProfileDescription` would return the Mac script string from a profile if it was present and, if not, it would return the 7-bit Roman ASCII string. The Unicode string was ignored and in some cases, if the Unicode and/or Mac script-code string were non-compliant, ColorSync would return garbage (or the ASCII string if you were lucky) without returning `cmProfileErr` code.

ColorSync 2.6 is the first release of the technology that was designed to run both on Mac OS and Windows. Since script-code format strings are not usable on Windows, ColorSync clients need to have access to the localized Unicode strings (Unicode strings are also becoming more usable on Macs.) For this reason a new call, `CMGetProfileDescription` added to access all three possible strings. In doing so much stricter attention had to be paid to the compliance of the tag. For example, if either the ASCII string or the Mac script-code strings is not null terminated, or if any of the character counts are invalid or beyond the range of the 'desc' tag, the `cmProfileErr` code is returned.

In order to achieve optimal performance when applications add profiles to a list or pop-up menu, ColorSync maintains a cache of all the profiles installed in the "ColorSync Profiles" folder and its sub-directories. Among other things this cache contains the three possible names of each profile obtained by calling `CMGetProfileDescriptions`. If `CMGetProfileDescriptions` returns an error because the 'desc' tag is non-compliant, then the profile is not added to the cache. This is why non-compliant profiles, even though they are properly installed in the "ColorSync Profiles" folder, no longer show up in the ColorSync control panel or the ColorSync plug-ins pop-up menus with ColorSync 2.6 installed.

The remedy for this problem is to repair the affected profiles. Unfortunately, the "Rename Profile" AppleScript tool installed as part of ColorSync 2.6 can not be used to repair profiles with bad 'desc' tags because it can only operate on profiles in the ColorSync profile cache. Instead, a simple stand-alone tool called "Profile First Aid" to verify and repair profiles will be made available on the the ColorSync web site <<http://www.apple.com/colorsync>>.

[Back to top](#)

## ColorSync 2.6 for Macintosh Compatibility Issues

### ColorSync 1.X/2.X Support

Support for version 1.0 profiles and hybrid (1.0/2.0) color worlds has been removed in ColorSync 2.6 for Mac. ColorSync 1.0 profiles, APIs and CMMs are not supported.

### CMM

No longer required to support ColorSync 1.0 Profiles. Existing CMMs will be compatible.

New CMM APIs: `NCMConcatInit`, `NCMNewLinkProfile` (see section "[New CMM APIs](#)" for the details) which may choose to implement. If a given CMM does not implement these new APIs, the default CMM is invoked instead.

### Profile Searching

ColorSync 2.6 will support new profile locations (System Folder) for Profile searches made with the search function (`CMNewProfileSearch`, etc.). Profiles in subfolders within the profiles folder will be found as well.

### Color Worlds

New API `NCWConcatColorWorld` (see section "[New ColorSync 2.6 APIs](#)" for the details) puts power and responsibility for color world design into the hands of developers. Callers can select which profile tags and rendering intents to use, which allows for new combinations of profiles which were previously not supported (e.g., more than one device-link profile).

### QuickDraw Matching

2.X QuickDraw calls will continue to be supported (`N/NCMBeginMatching`, `CMEndMatching`, `N/CMDrawMatchColor`, `CWMatchPixelFormat`, `CWCheckPixelFormat`).

## Scripting & File Formats

JPEG, GIF as well as TIFF file format plug-ins are now supported.

## Endian Issues

If an API returns data in a structure, the data will be in the proper endian-ness for the platform i.e., Big-Endian (Little-Endian under Windows. For example, the `CMGetCWI nfo` function returns data in a `CMCWI nfoRecord` structure. If the function is called on a Macintosh, the data in the structure would be returned in Big-Endian format.

If data is passed to or returned by an API as simply a stream of bytes, the data is assumed to be in Big-Endian format. It is the caller's responsibility to convert from native Endian to Big-Endian format.

[Back to top](#)

# ColorSync 2.6 for Windows Compatibility Issues

## CMM

CMMs need only support the following entry points:

`CMMatchBi tmap`, `CMMCheckBi tmap`, `CMMConcatIni t`, `CMMCheckCol ors`, `CMMCl ose`, `CMMGetCMMI nfo`, `CMMMatchCol ors`, `CMMOpen`, `NCMMI ni t`

## New CMM APIs:

`NCMMConcatIni t`, `NCMMNewLi nkProfi l e` (see section "[New CMM APIs](#)" for the details) which a CMM may choose to implement. If a given CMM does not implement these new APIs, the default CMM is invoked instead.

## ColorSync 1.X/2.X Support

Applications writing to the 2.X APIs will require minimal changes to work. ColorSync 1.0 Profiles, APIs and CMMs are not supported.

## Profile Access

ColorSync 2.6 places a "ColorSync Profiles" folder directly in the System Folder. A new location type `CMPathL` (see section "New `CMProfi l eLocati on` Types" below) describing the Windows file system specification for this folder has been added to the `CMProfi l eLocati on` structure.

## New `CMProfileLocation` Types

`CMProfi l eLocati on` Expanded - new location types have been added to the `CMProfi l eLocati on` structure to give developers a way to specify profiles on Windows systems.

Current Location types:

`CMFi l eLocati on`  
`CMHandl eLocati on`  
`CMPtrLocati on`  
`CMProceduralLocati on`

New Location types:

<b>CMPathLocation</b>	(specify path as string of chars)
<b>CMBufferLocation</b>	(contains ptr and size)

```
#define CS_MAX_PATH      256      // How many chars allowed in path name

struct CMPathLocation {
    char    path[CS_MAX_PATH];      // A complete path
};

struct CMBufferLocation {
    void *   buffer; // Ptr to profile data
    UInt32   size;   // Size of Ptr
};

union CMProfLoc {
    CMFileLocation      fileLoc;
    CMHandleLocation    handleLoc;
    CMPtrLocation       ptrLoc;
    CMProcedureLocation procLoc;
    CMPathLocation      pathLoc;
    CMBufferLocation     bufferLoc;
};

enum {
    cmNoProfileBase      = 0,
    cmFileBasedProfile   = 1,
    cmHandleBasedProfile = 2,
    cmPtrBasedProfile    = 3,
    cmProcedureBasedProfile = 4,
    cmPathBasedProfile   = 5,
    cmBufferBasedProfile = 6
};
```

## Profile Searching

ColorSync 2.6 for Windows supports standard locations (System Folder) for Profile searches.

## QuickDraw Matching

ColorSync 2.6 for Windows does not support the following APIs:

N/NCMBeginMatching, CMEndMatching, N/CMDrawMatchedPicture, CWMatchPixelFormat, CWCheckPixelFormat.

PixMaps can easily be matched via the CMBitMap routines.

## Win32 Matching

New API CWMatchHBITMAP (see section "[New ColorSync 2.6 APIs](#)" above) supports direct matching/checking

HBITMAP structure

## Endian Issues

If an API returns data in a structure, the data will be in the proper endian-ness for the platform i.e., Big-Endian or Little-Endian under Windows. For example, the `CMGetCWI nfo` function returns data in a `CMCWI nfoRecord` structure. If the function is called on a Windows machine, the data in the structure would be returned in Little-Endian format.

If data is passed to or returned by an API as simply a stream of bytes, the data is assumed to be in Big-Endian format. It is the caller's responsibility to convert from native Endian to Big-Endian format.
