Hospital :

Location: {*Homedir of mindmap*}*Samples\Hosp*

Files:

hosp.mm	mindmap application file
person.dbf	Person database (dBase)
hosppa.dbf	Patient database (dBase)
hosppa.dbt	Memo file (dBase)
hospfor.dbf	Patient Q&A database (dBase)
*.bmp	Various x-rays
Hospital.Wri	This file

Create a dBase database named "Example" which uses the directory where the three dbf files are located !

Manual:

The "Hospital" program consists of two segments:

- In Patient:
  When a new patient is accepted, their personal data must be entered into the patient tracking system. After this has been completed, the patient is directed to the doctor. The doctor then uses the patient section of the application. Once the patient has been treated, they are returned to the In Patient section and their release data is entered.

- Patient:
  The doctor enters the diagnostic results (*including medication and possible X-rays*) into the database. The decision of which ward the patient is to be placed into is also entered.
