Author

1.2 what

pr2m is simple converter from c compatible pragma includes to d compatible
library modules.

Source code is included in PowerD archive ('d:source/pr2m.e'). You can do
with it everything you like except selling it.

1.3 how

It has only two arguments:

SOURCE/A: source pragma include name.
SASC/S: if you converts sasc compatible pragmas enable this.

If SASC switch not enabled and 'name' entered, it will try to open file
called: 'name_lib.h', if SASC switch enabled, it will try to open file
called: 'name_pragmas.h'.
pr2m will create file 'name.m' what should be copied into 'dmodules:'
drawer.
